

# Learn OpenStack Over Lunch

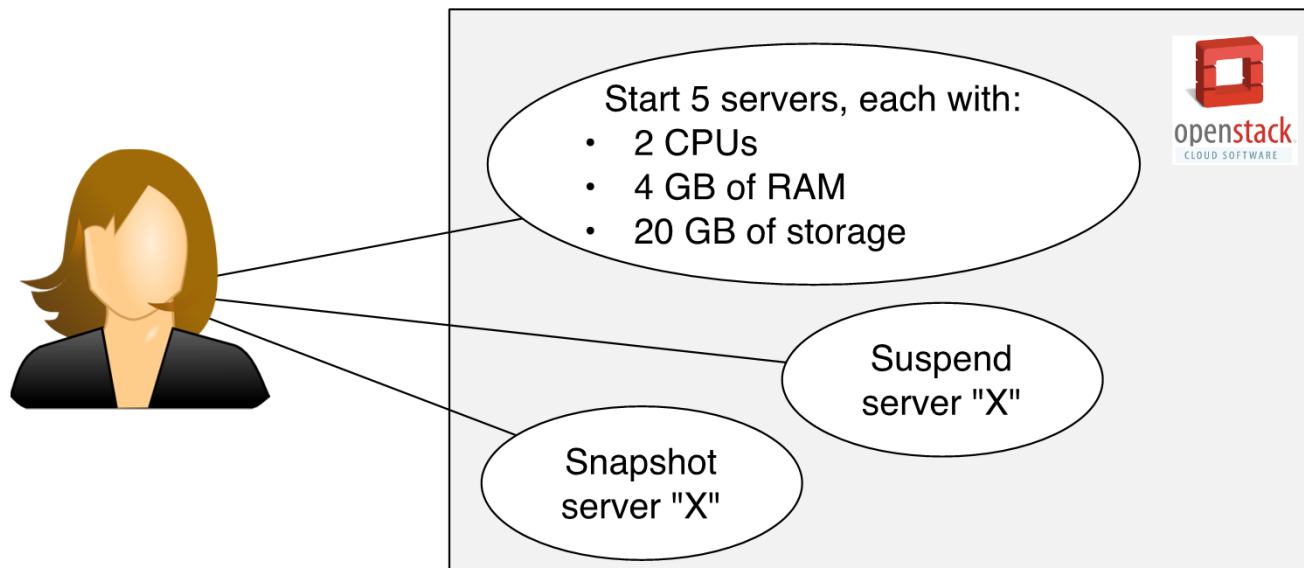

1

Tom Fifield  
tom@openstack.org  
@Tom Fifield

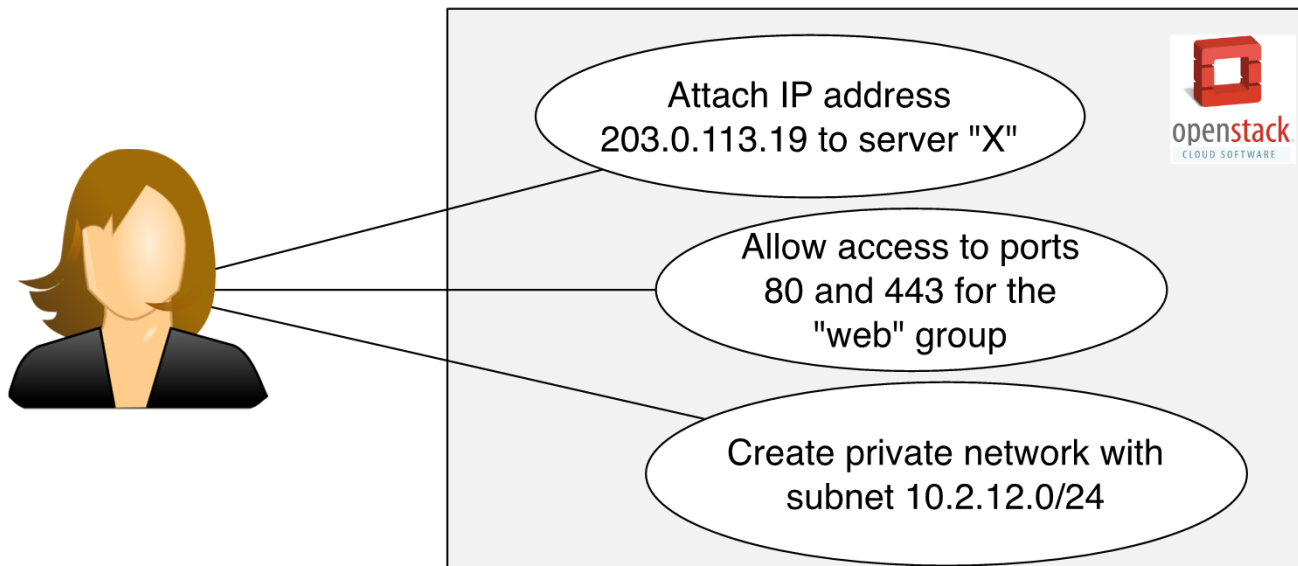

# OpenStack provides access to compute, networking and storage

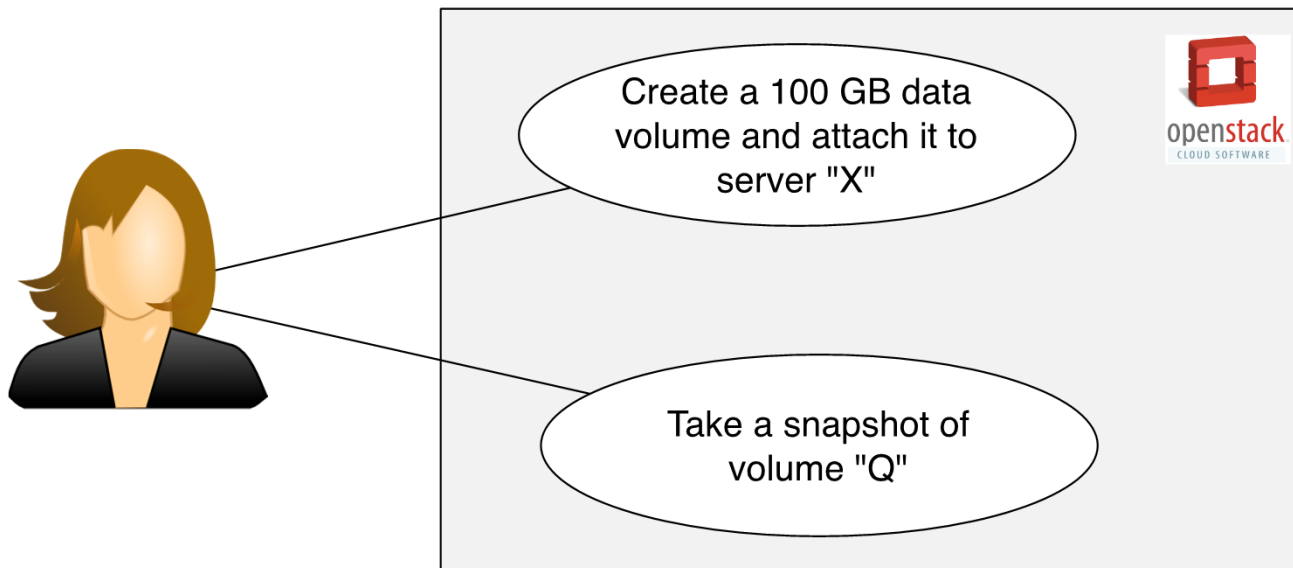

## Access **compute** resources

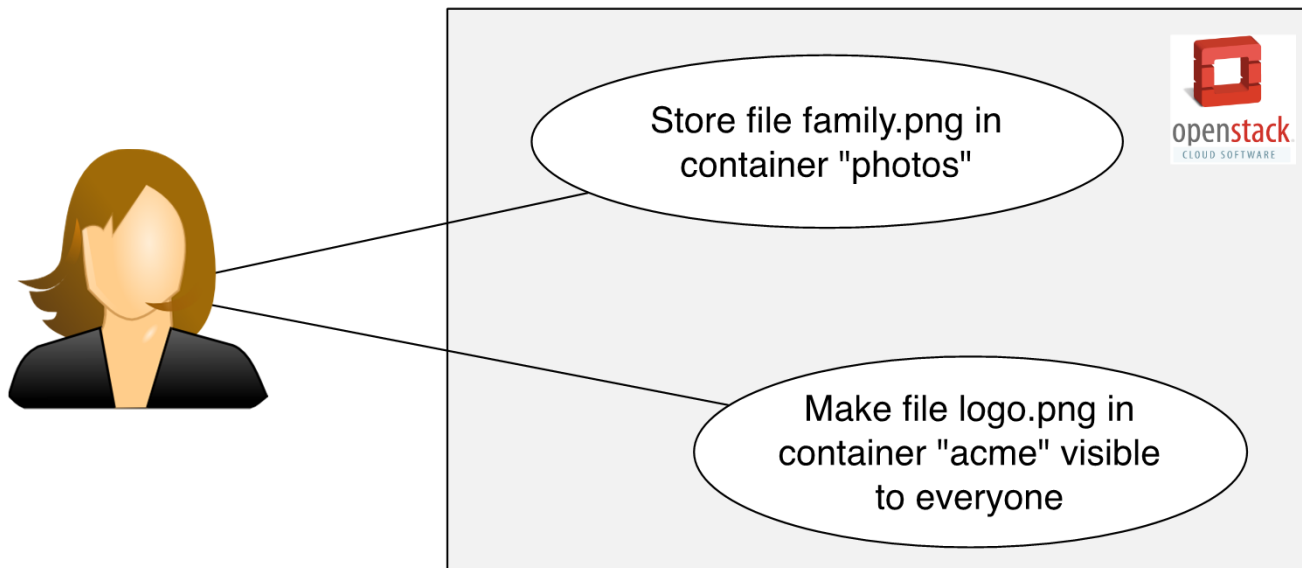

## Access networking resources

## Access **block storage** resources, which attach to servers like disks

## Access **object storage** resources, which are accessed over HTTP

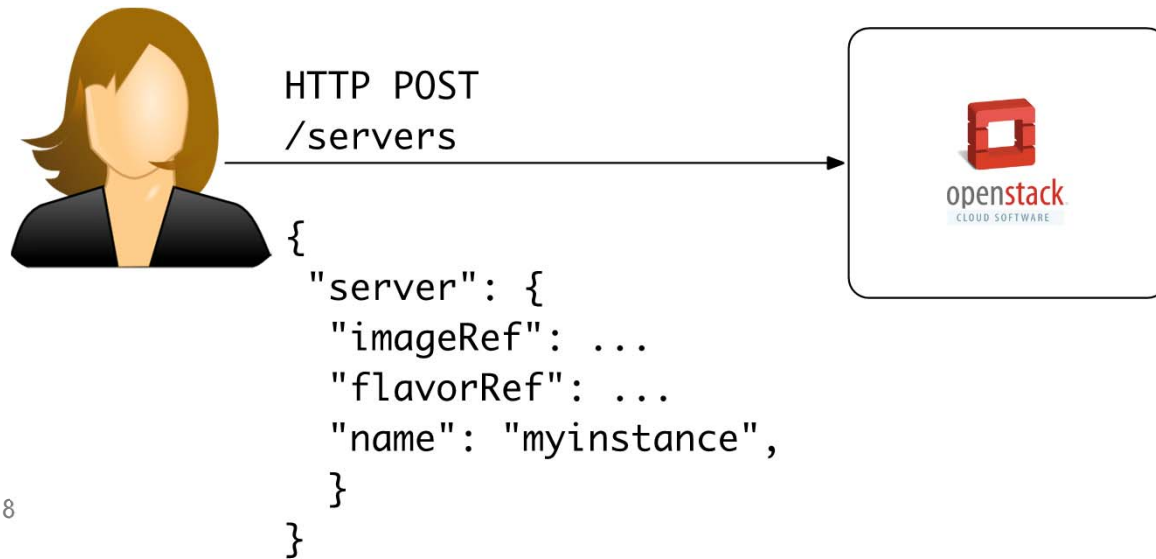

# OpenStack includes a web-based Dashboard service

The screenshot displays the OpenStack Nectar Dashboard interface. The top navigation bar includes the user email 'f1fieldt@unimeib.edu.au' and links for '設定', 'ヘルプ', and 'ログアウト'. The main content area is titled '概要' (Overview) and features four pie charts representing resource usage: 'インスタンス' (1 of 10 used), '仮想 CPU' (1 of 2 used), 'メモリー' (4.0 GB of 9.8 GB used), and 'セキュリティグループ' (6 of 10 used). Below these charts, there is a section for selecting a time period to check usage, with a '送信' (Send) button and a note that dates must be in YYYY-mm-dd format. A summary line indicates: '稼働中のインスタンス: 1 使用中のメモリー: 4GB 期間中の仮想 CPU 時間: 17.56 期間中の GB 時間: 702.40'. A '使用状況' (Usage Status) table is shown with a '概要 CSV のダウンロード' (Download Summary CSV) button. The table lists one instance named 'docwork' with 1 vCPU, 40 GB of disk, 4 GB of memory, and a runtime of 6 months and 3 weeks. A footer note says '1 項目を表示中' (Showing 1 item).

インスタンス名	仮想 CPU	ディスク	メモリー	稼働時間
docwork	1	40	4GB	6ヶ月, 3週間

## Make requests with command-line tools or REST API

```
$ nova boot --image precise --flavor m1.small myinstance
```

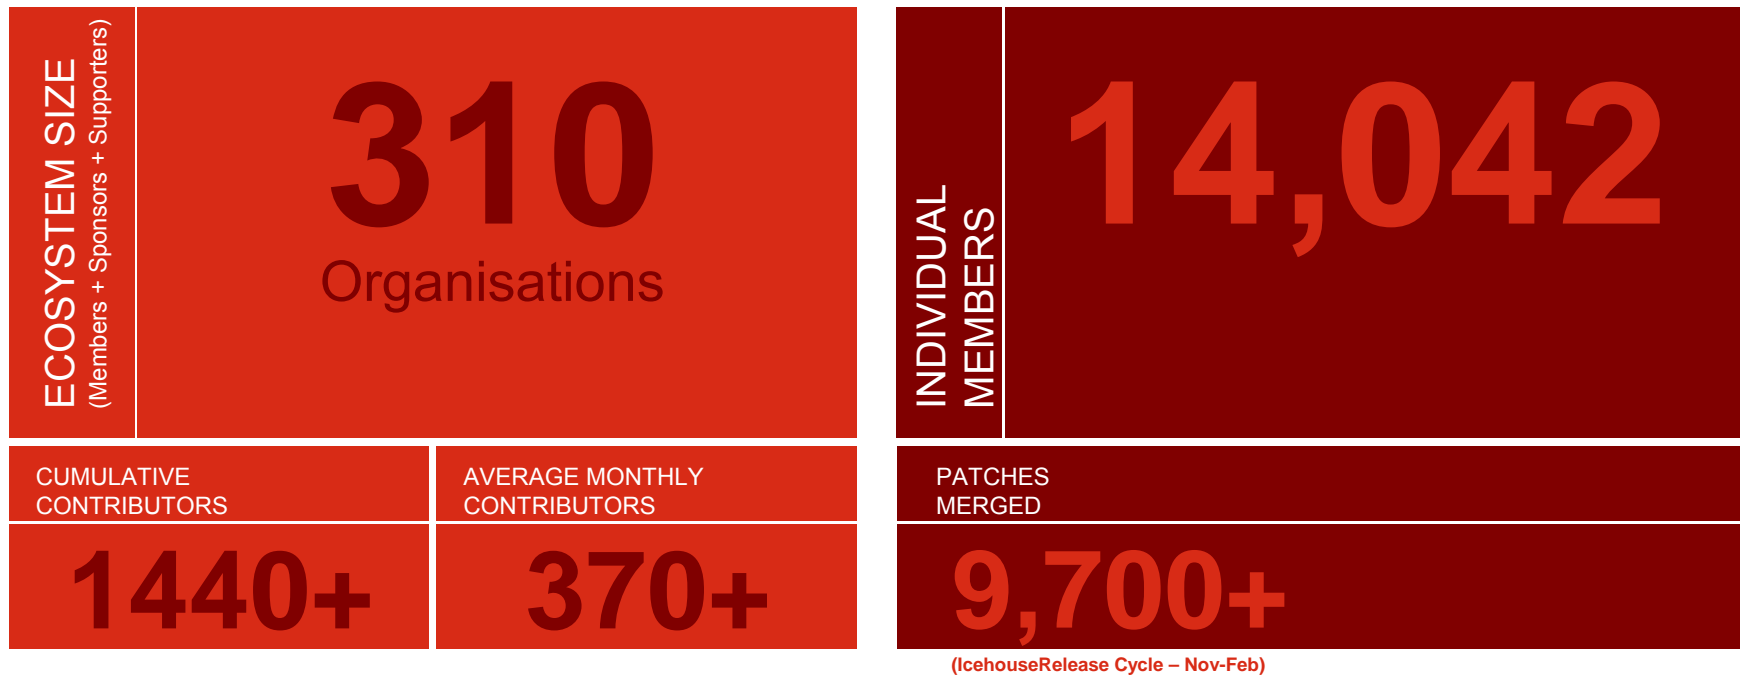

## Also... Python bindings!

```
import novaclient.v1_1.client as nvclient
creds = ...
nova = nvclient.Client(**creds)

image = nova.images.find(name="precise")
flavor = nova.flavors.find(name="m1.small")

nova.servers.create(image=image,
                    flavor=flavor,
                    name="myinstance")
```

# Project is very active with many contributors

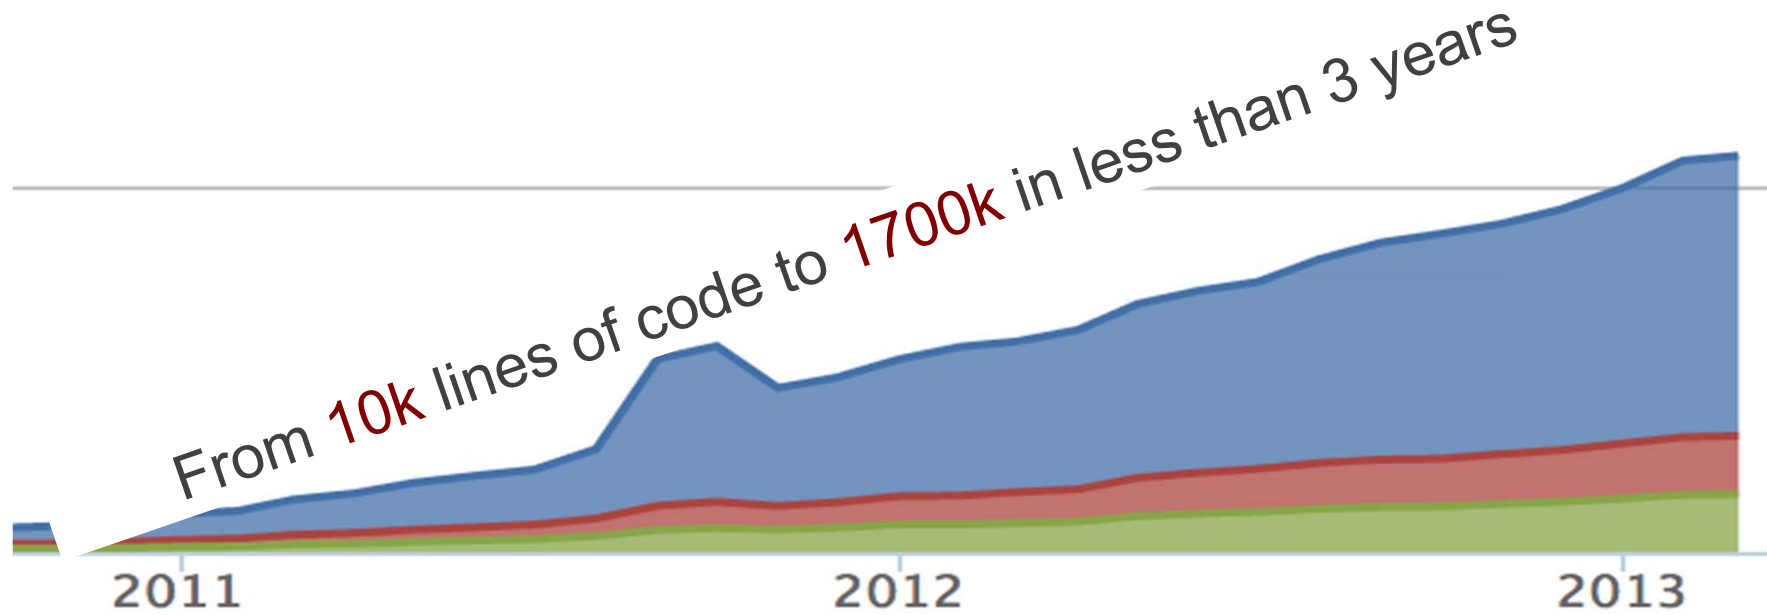

# Global Community

Countries with members

# Rapid Innovation

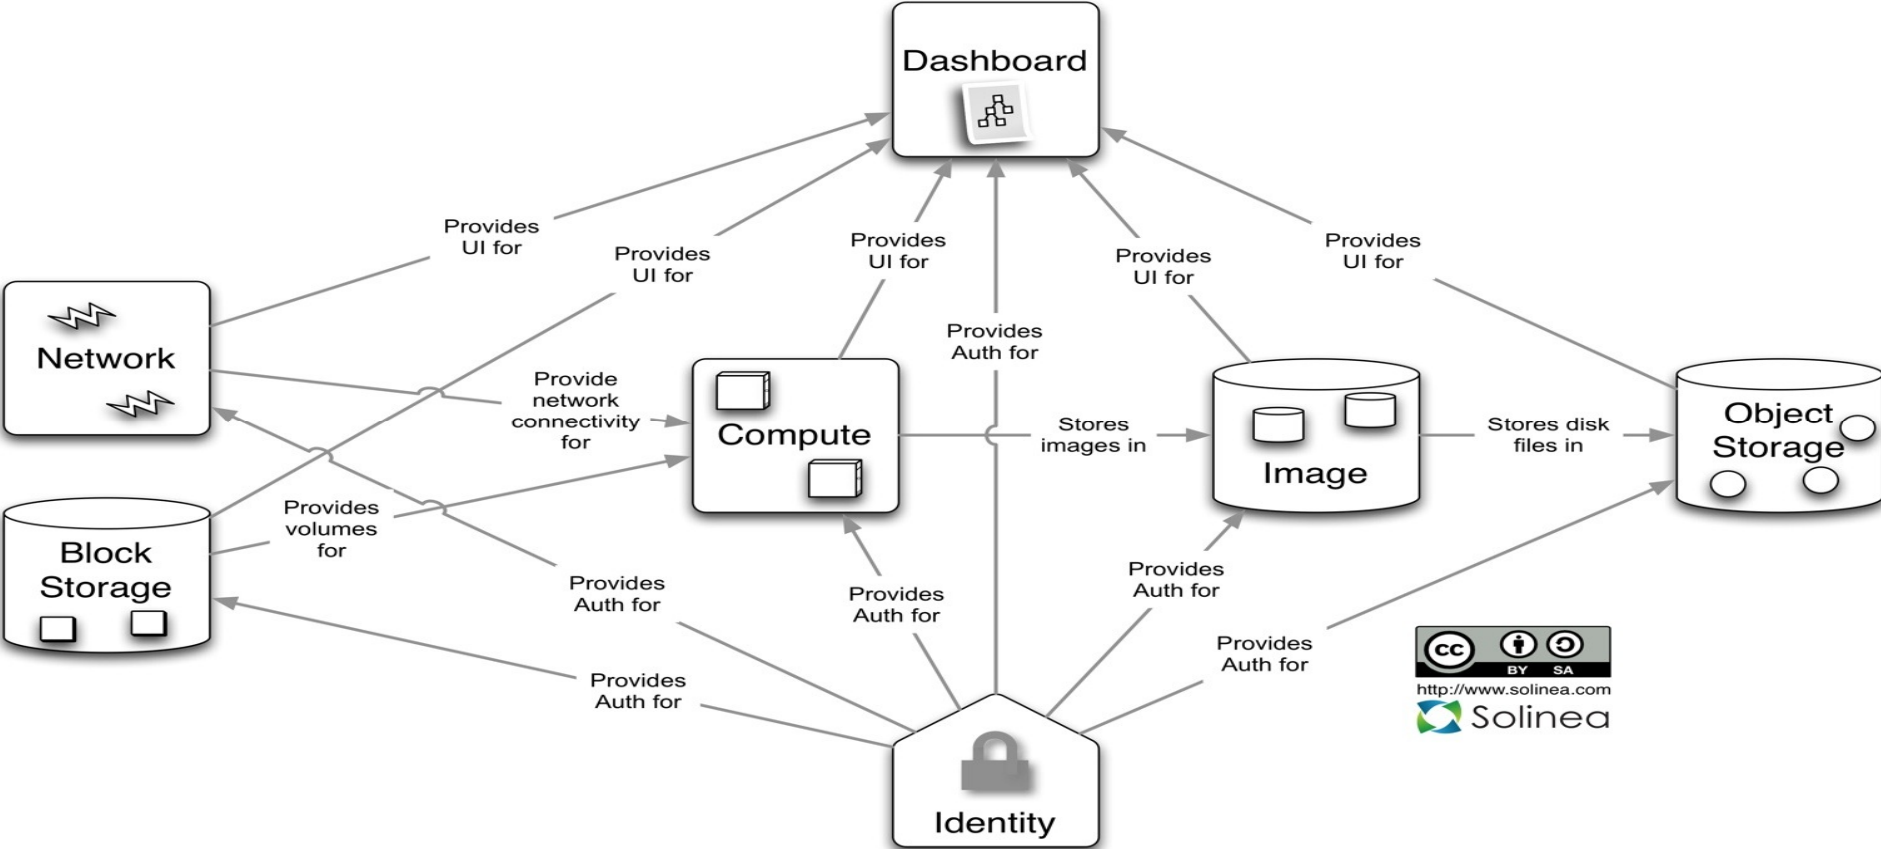

# To Name Just a Few...

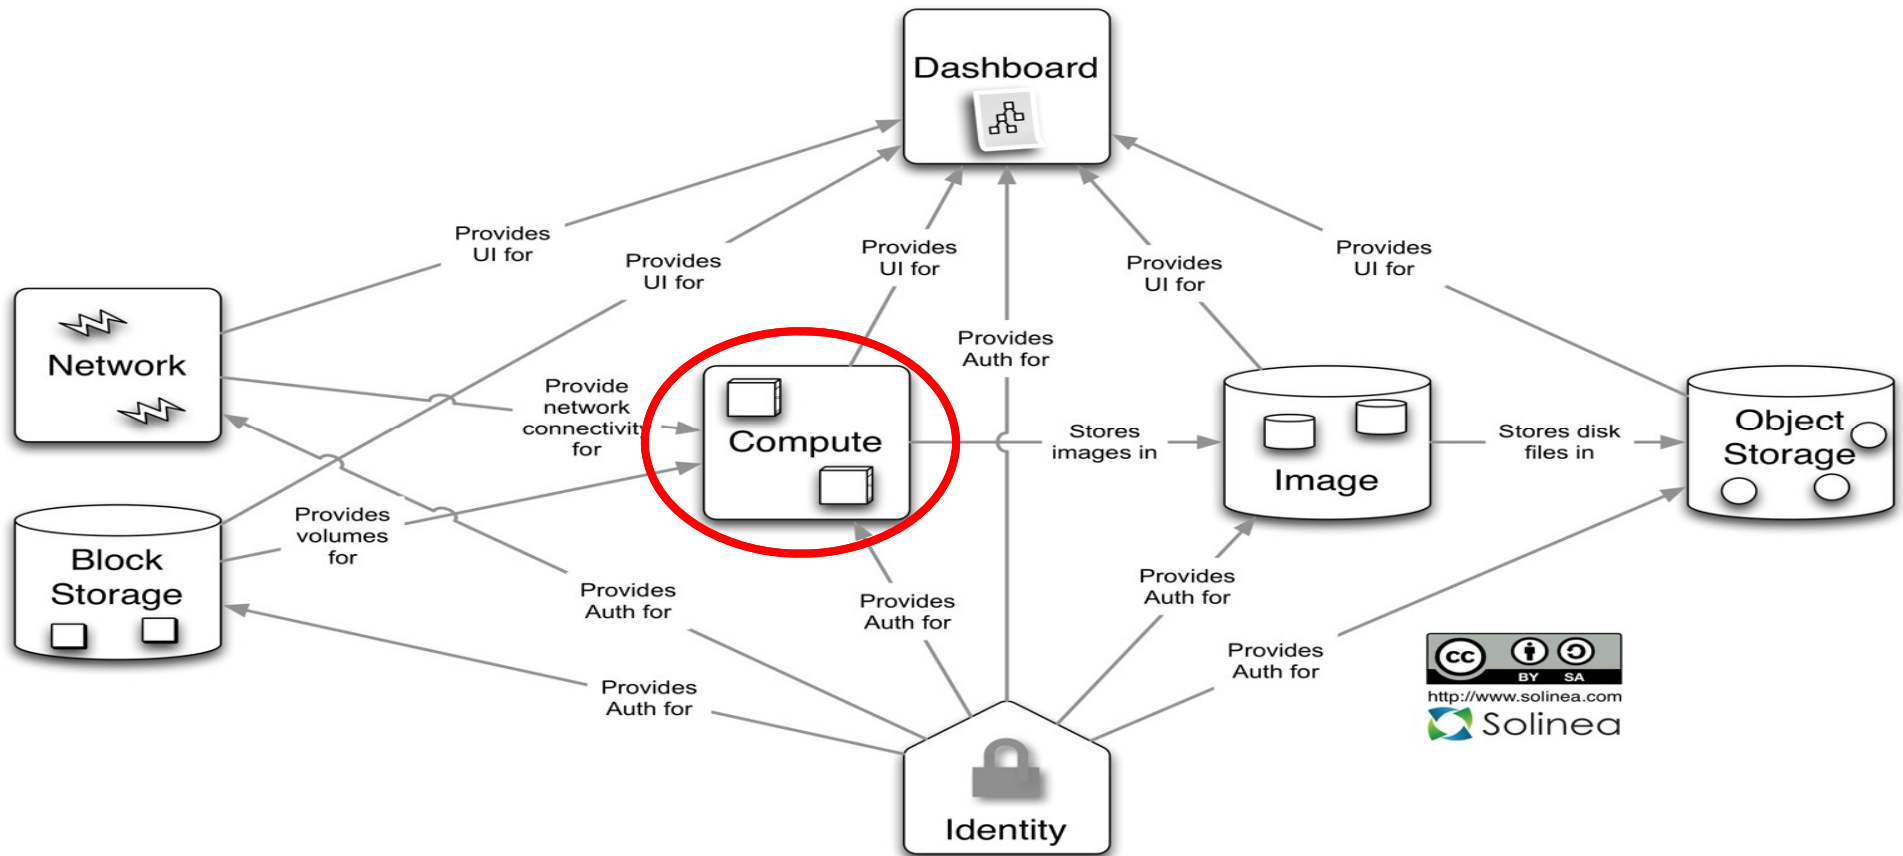

What does the architecture look like?

The image features a dark red background with a complex, abstract geometric composition on the right side. This composition consists of several overlapping, semi-transparent shapes in various shades of red, including dark red, medium red, and light red. The shapes are angular and layered, creating a sense of depth and architectural structure. The overall aesthetic is modern and minimalist.

# System is a collection of RESTful web services

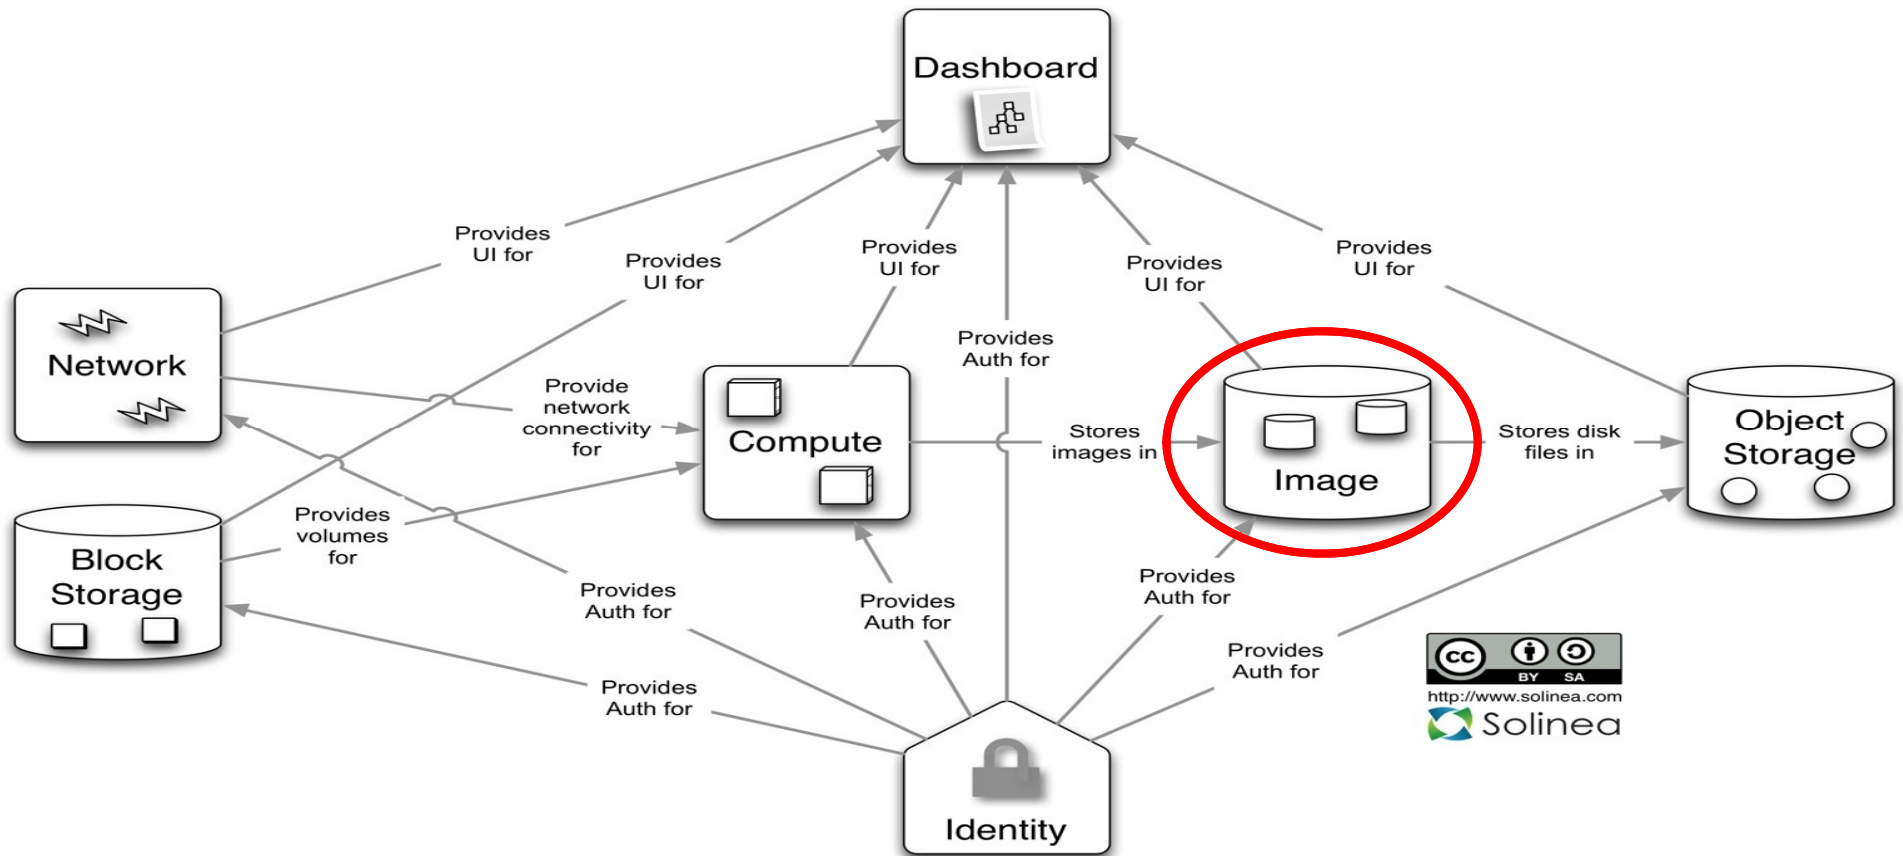

# Compute service manages VMs on compute nodes

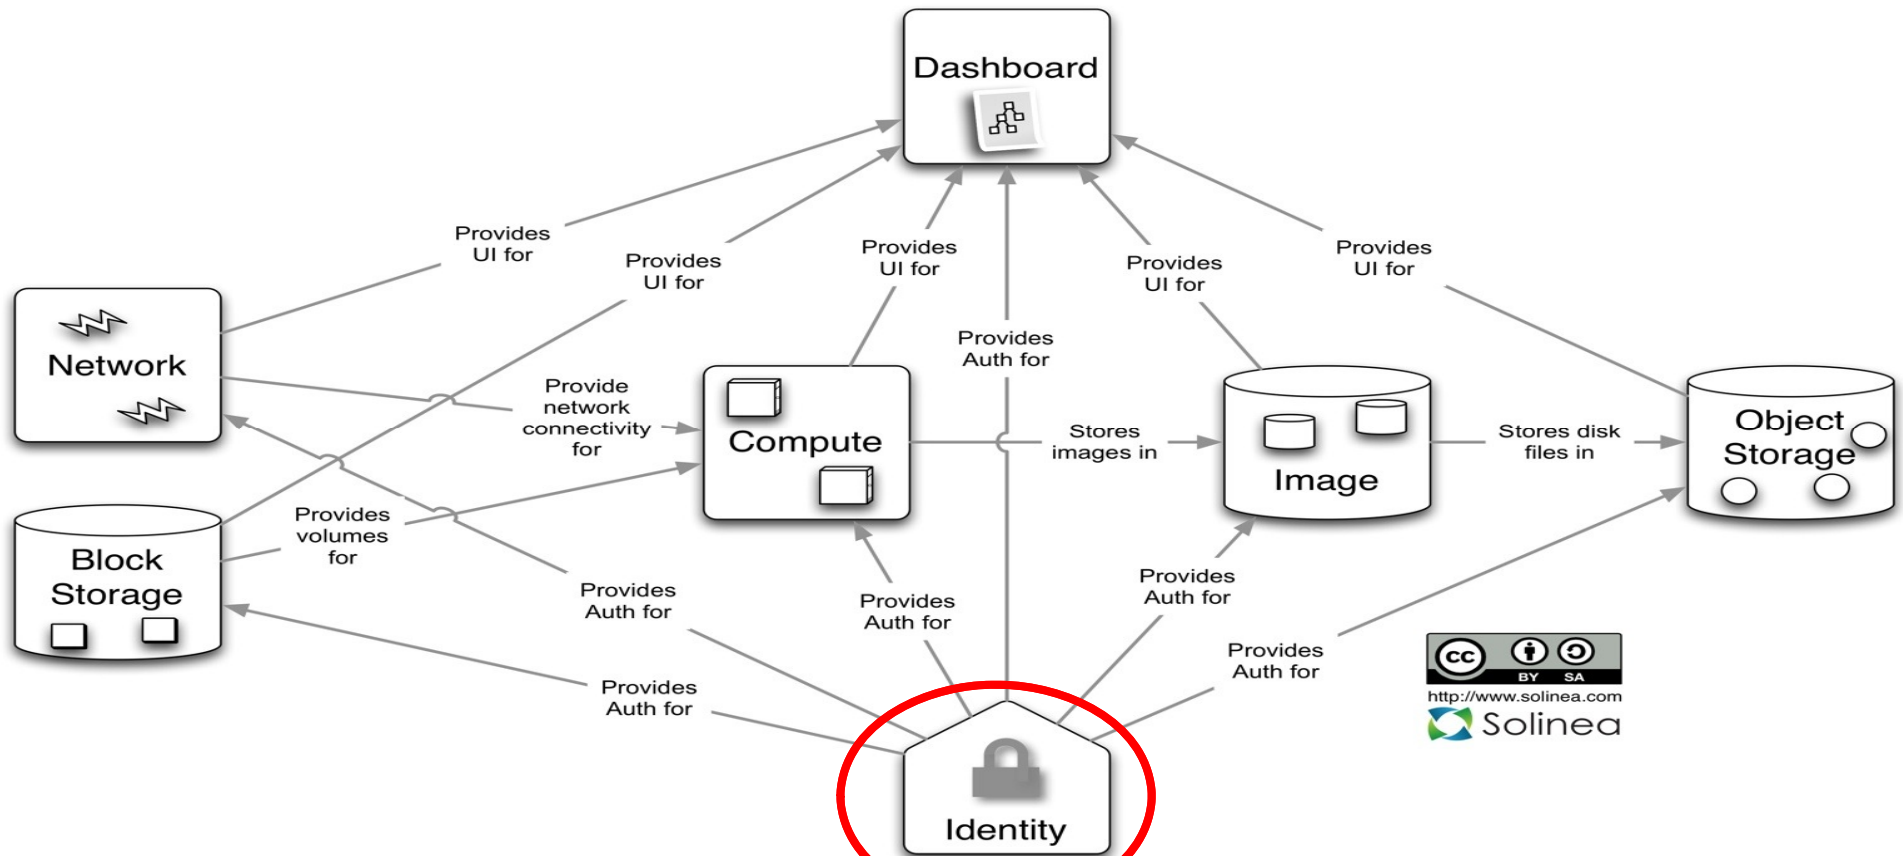

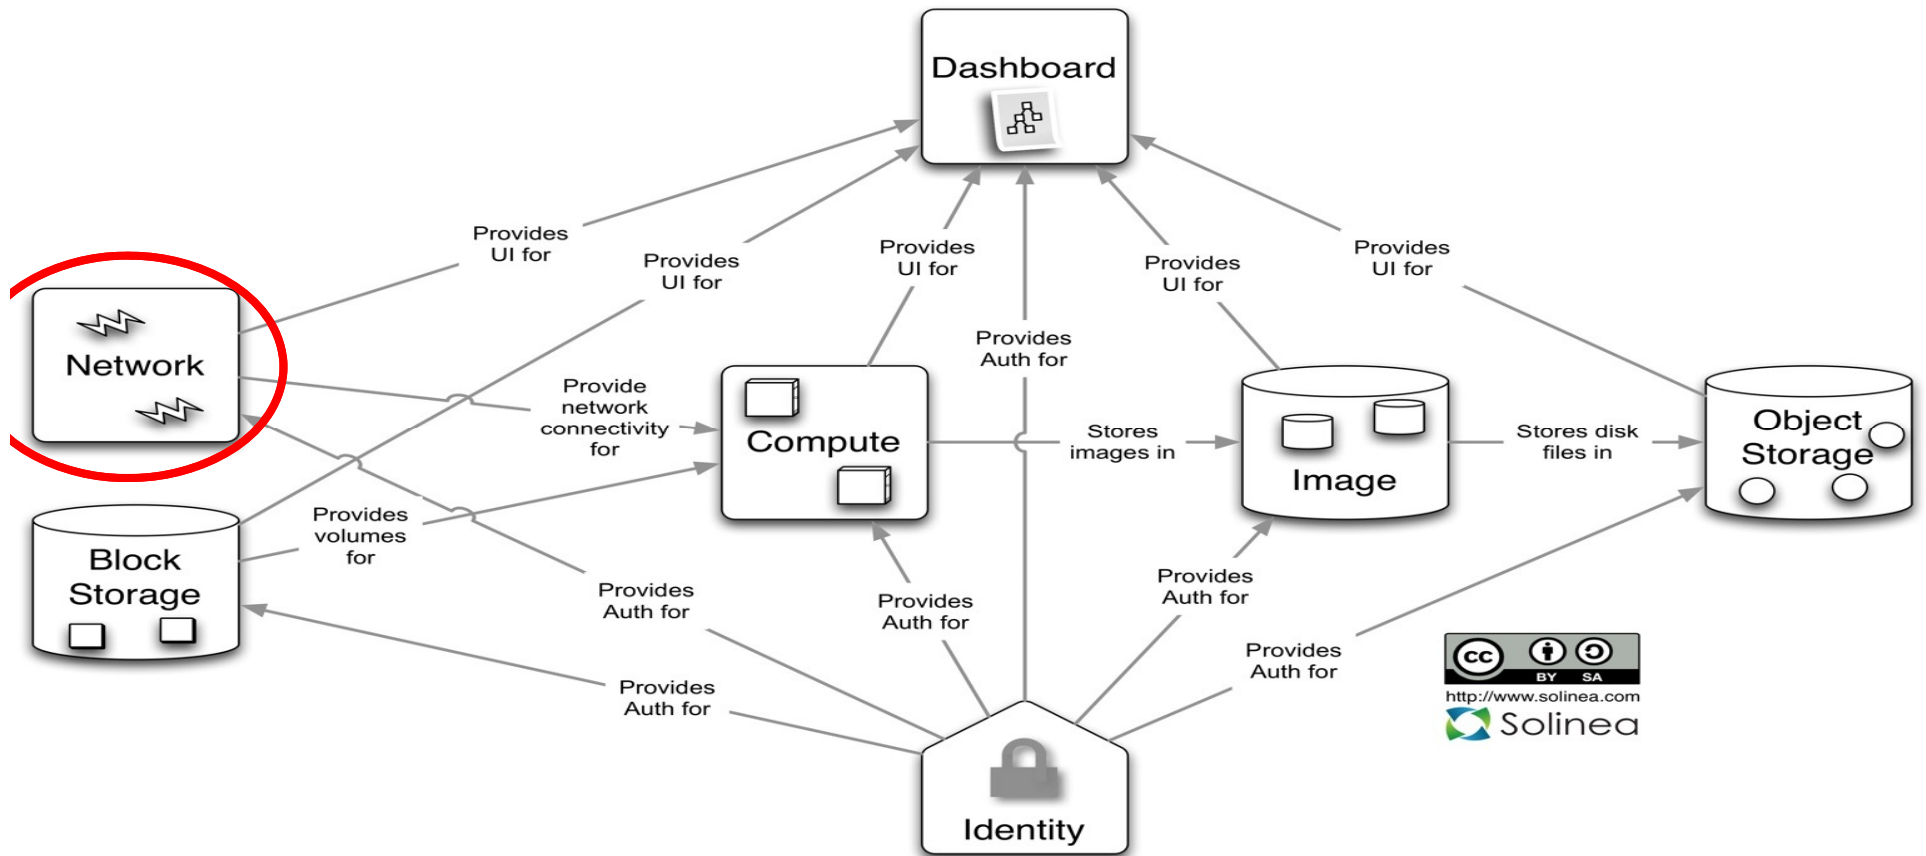

# Image provides a catalog of virtual machine images

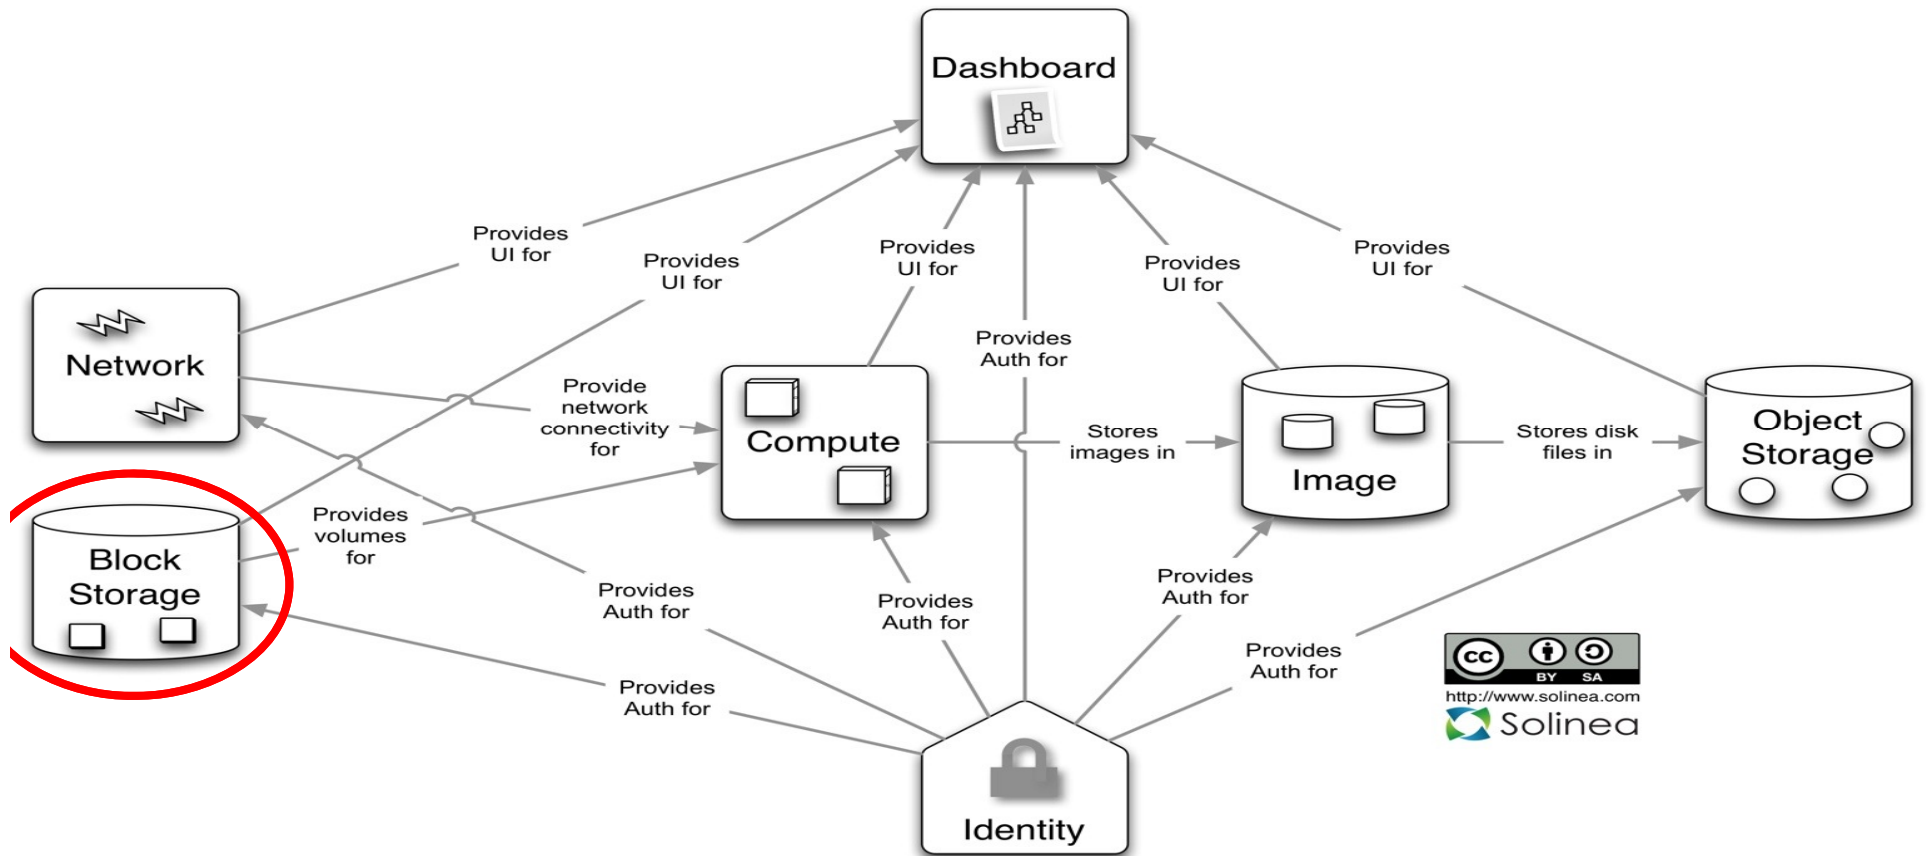

# Identity handles authentication and service catalog

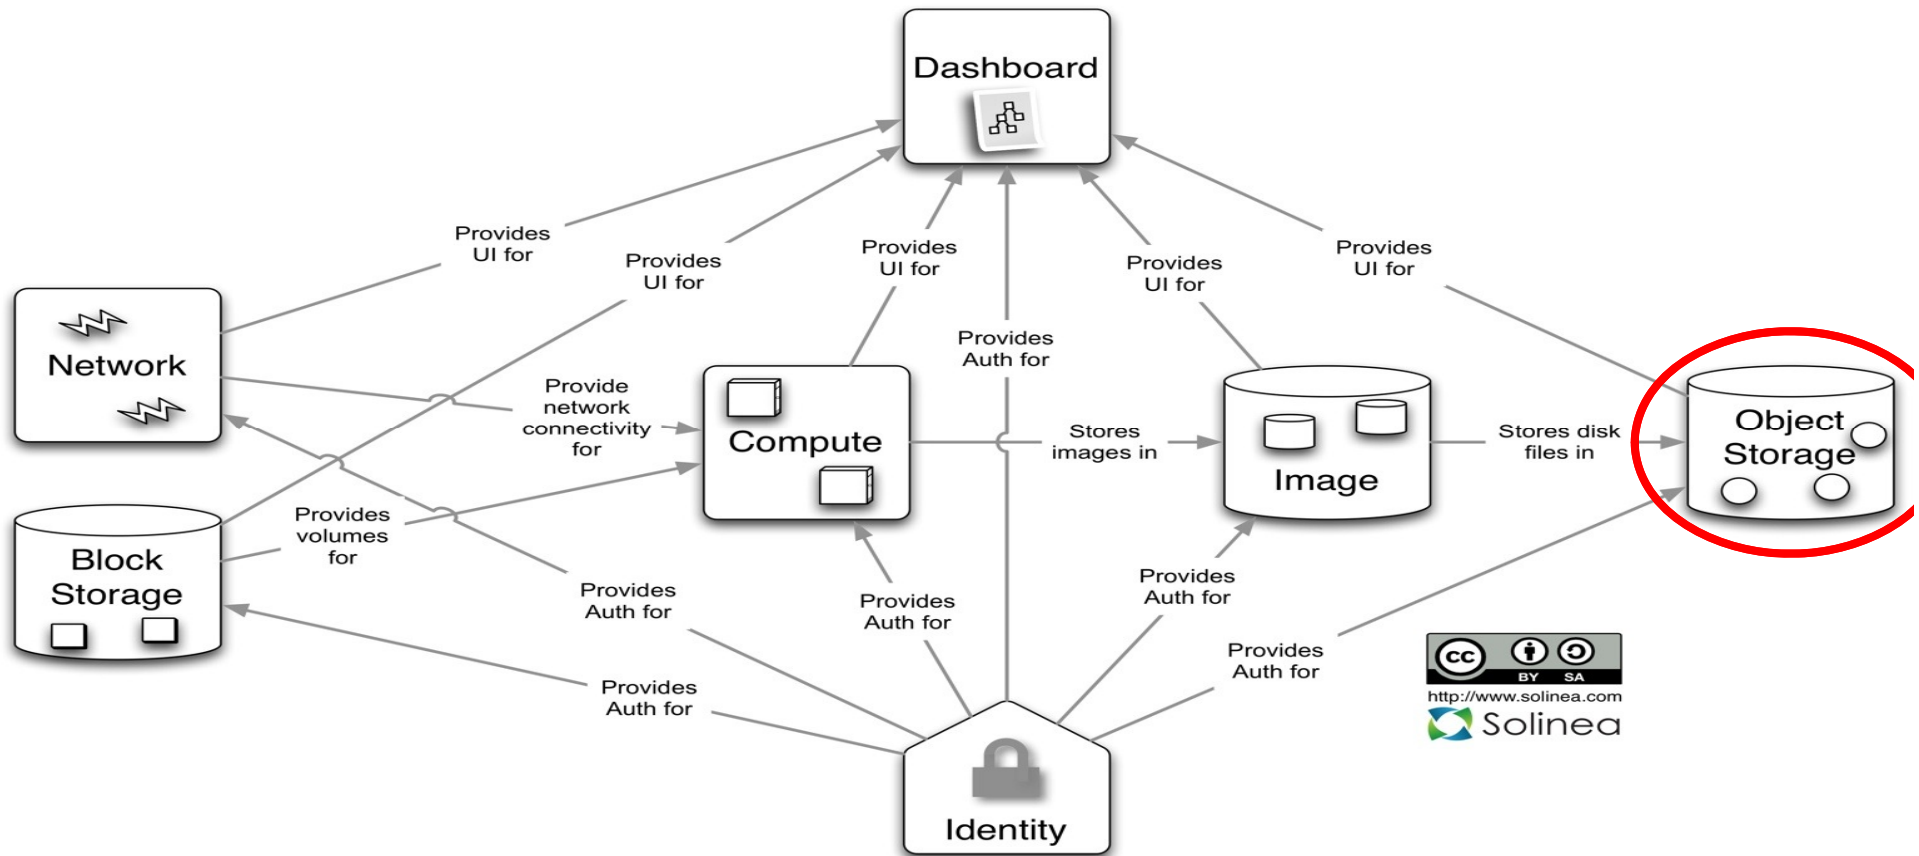

# Network service manages connectivity for VMs

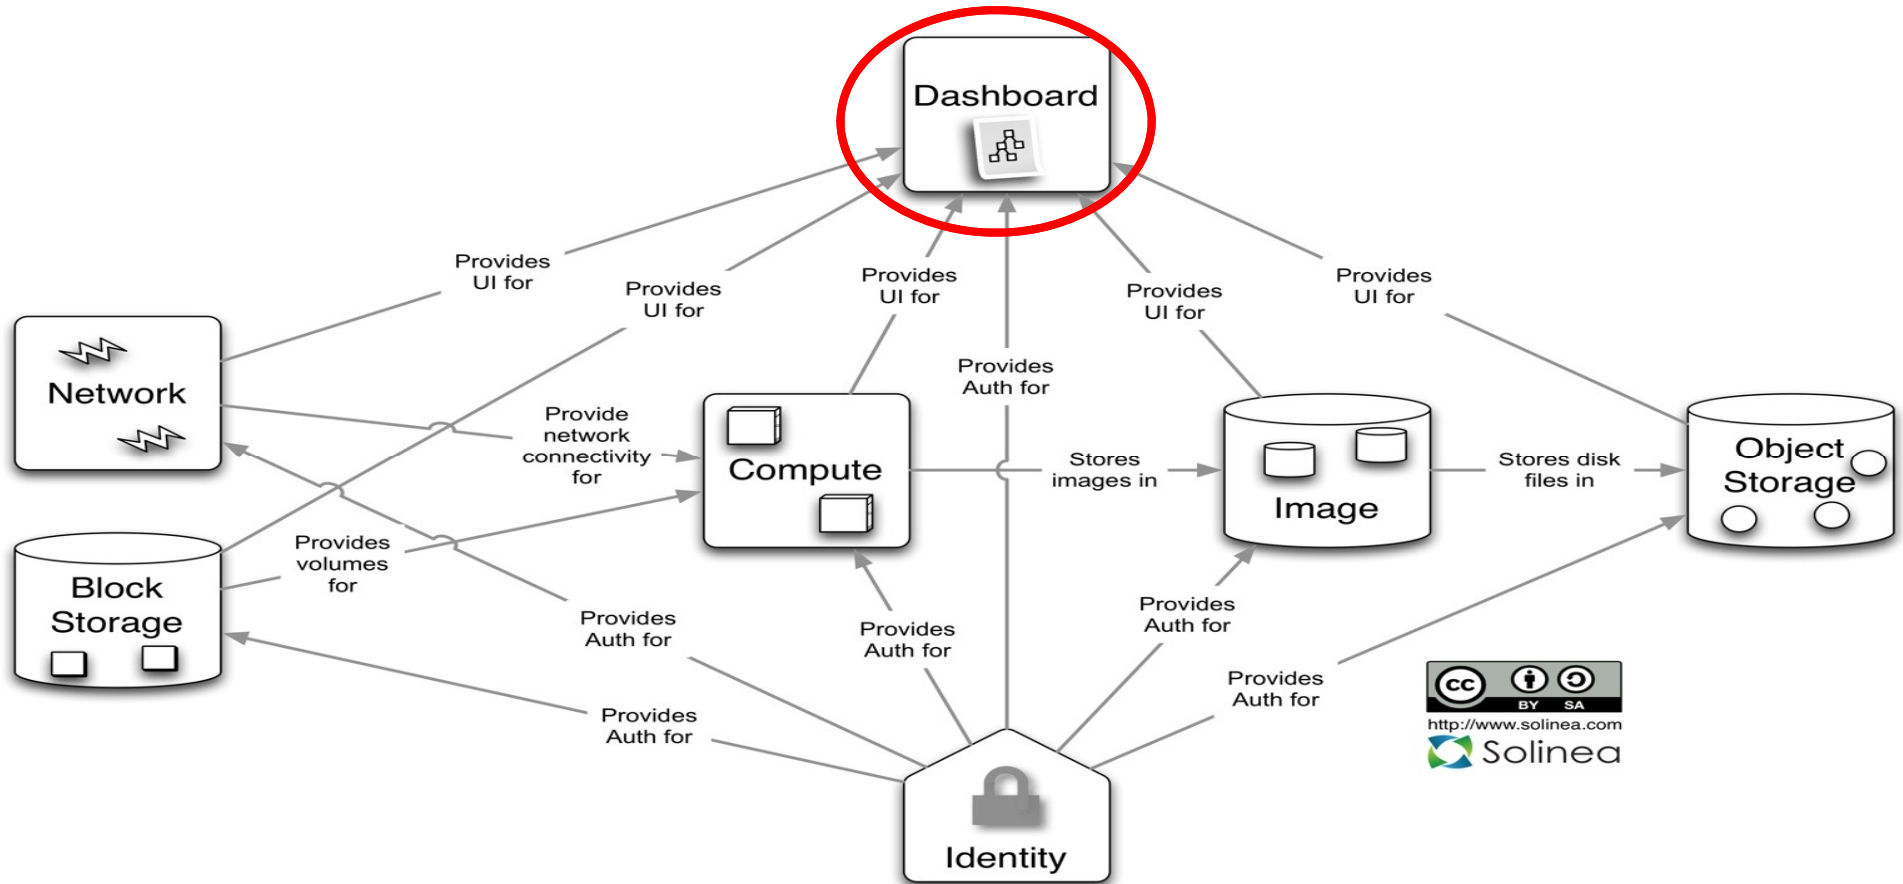

# Block storage manages block devices that attach to VMs

# Object storage manages binary objects accessed via HTTP

# Dashboard service provides web interface

Let's look at an example.

Alice is a web developer who needs an Ubuntu server to deploy her app for testing

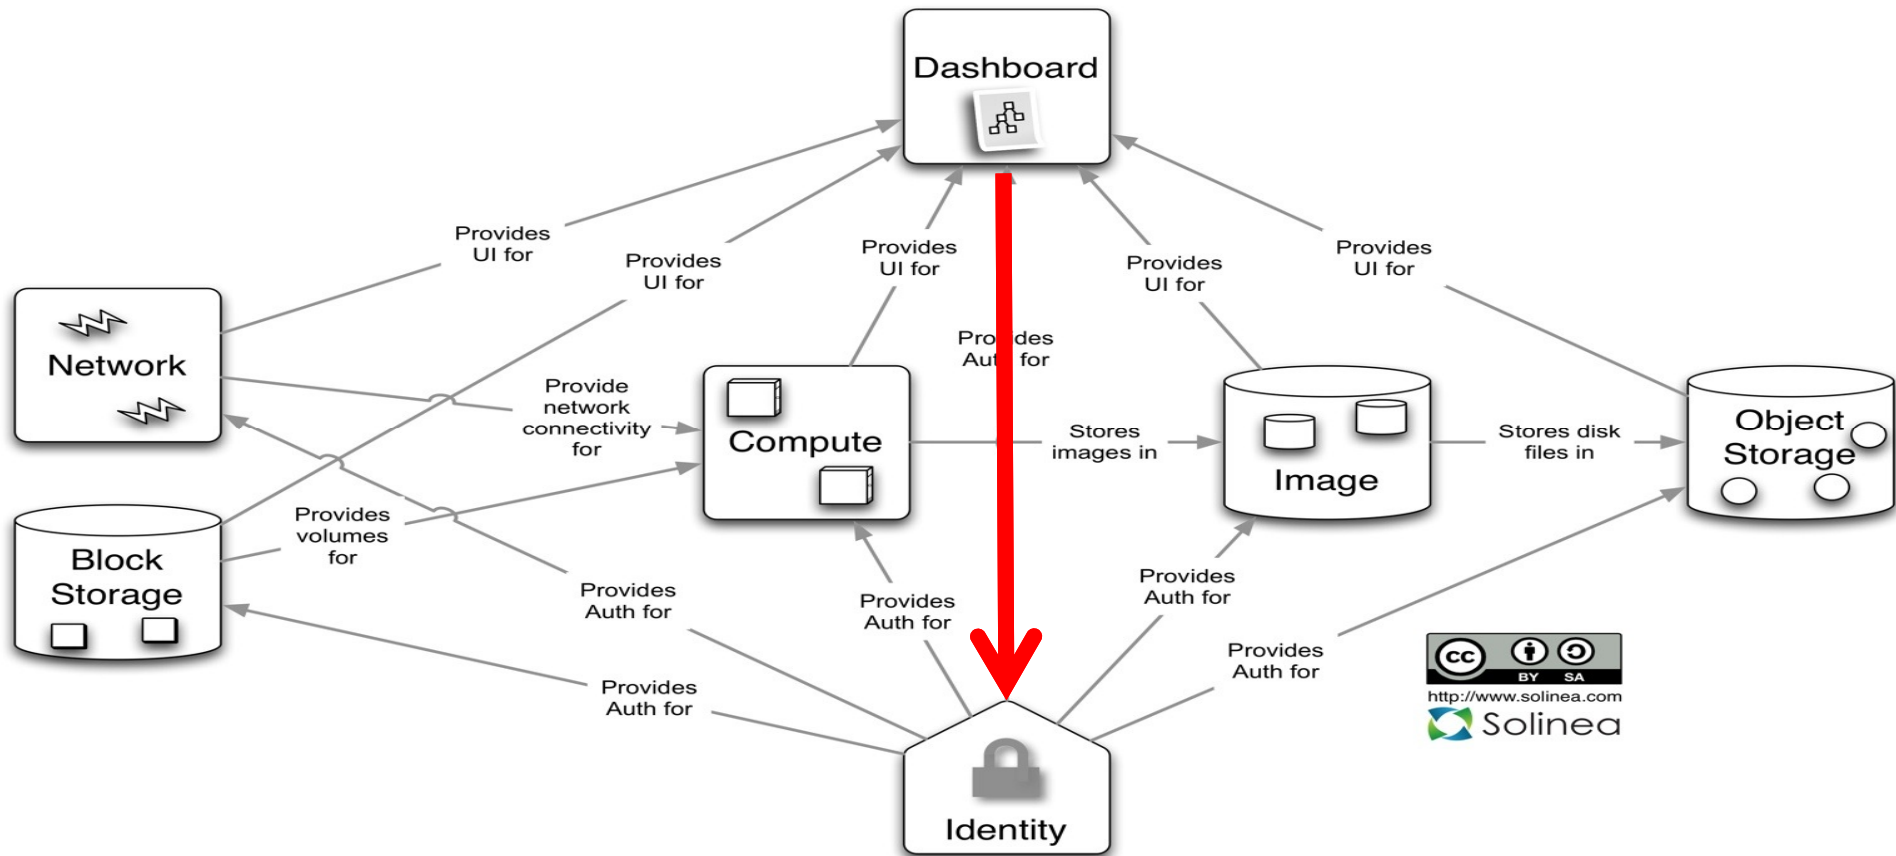

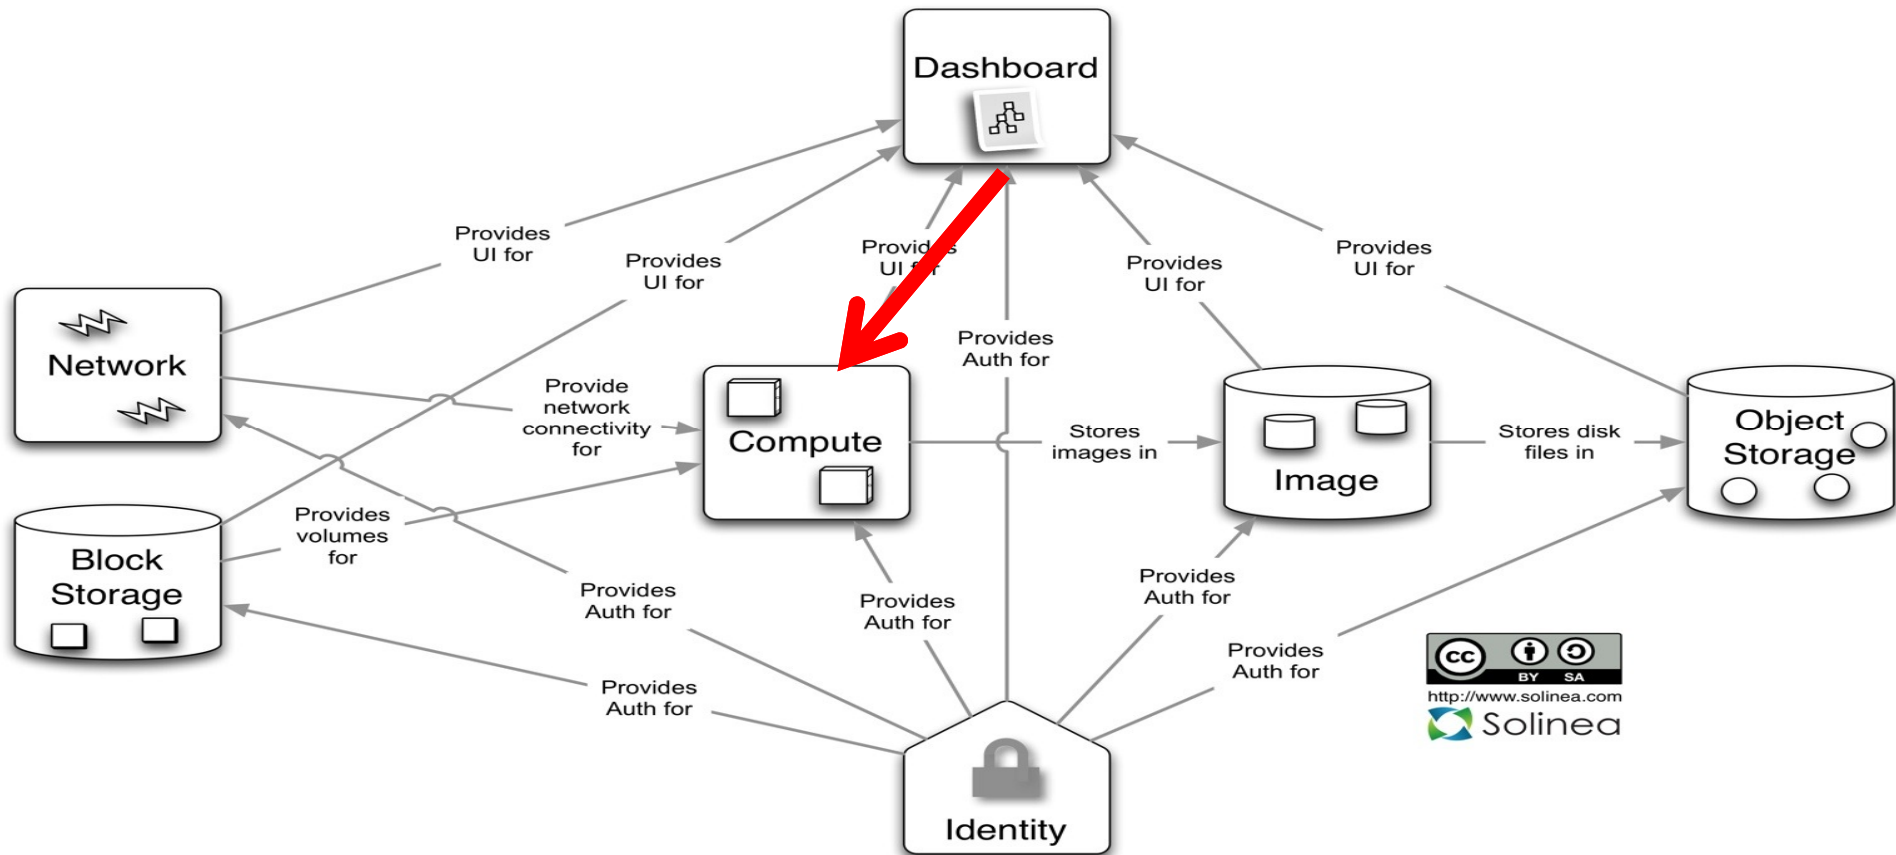

*Start a server using the 'ubuntu12.04' image and attach it to network 'mynet'*

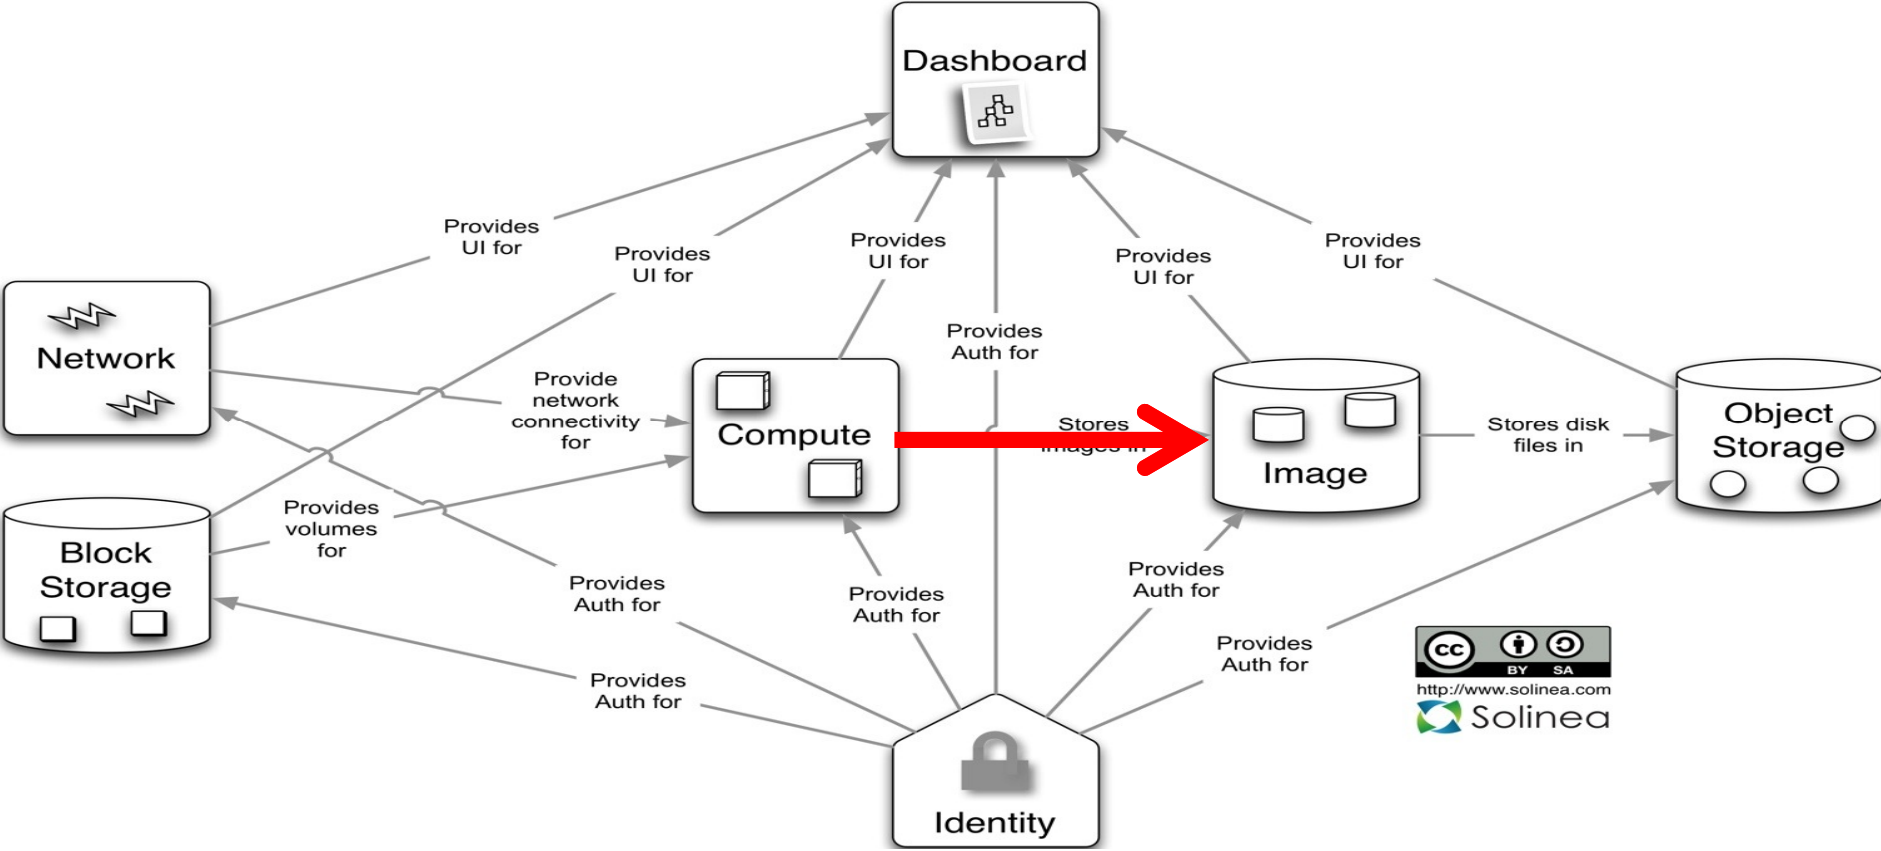

# 1. Get the compute endpoint and an auth token

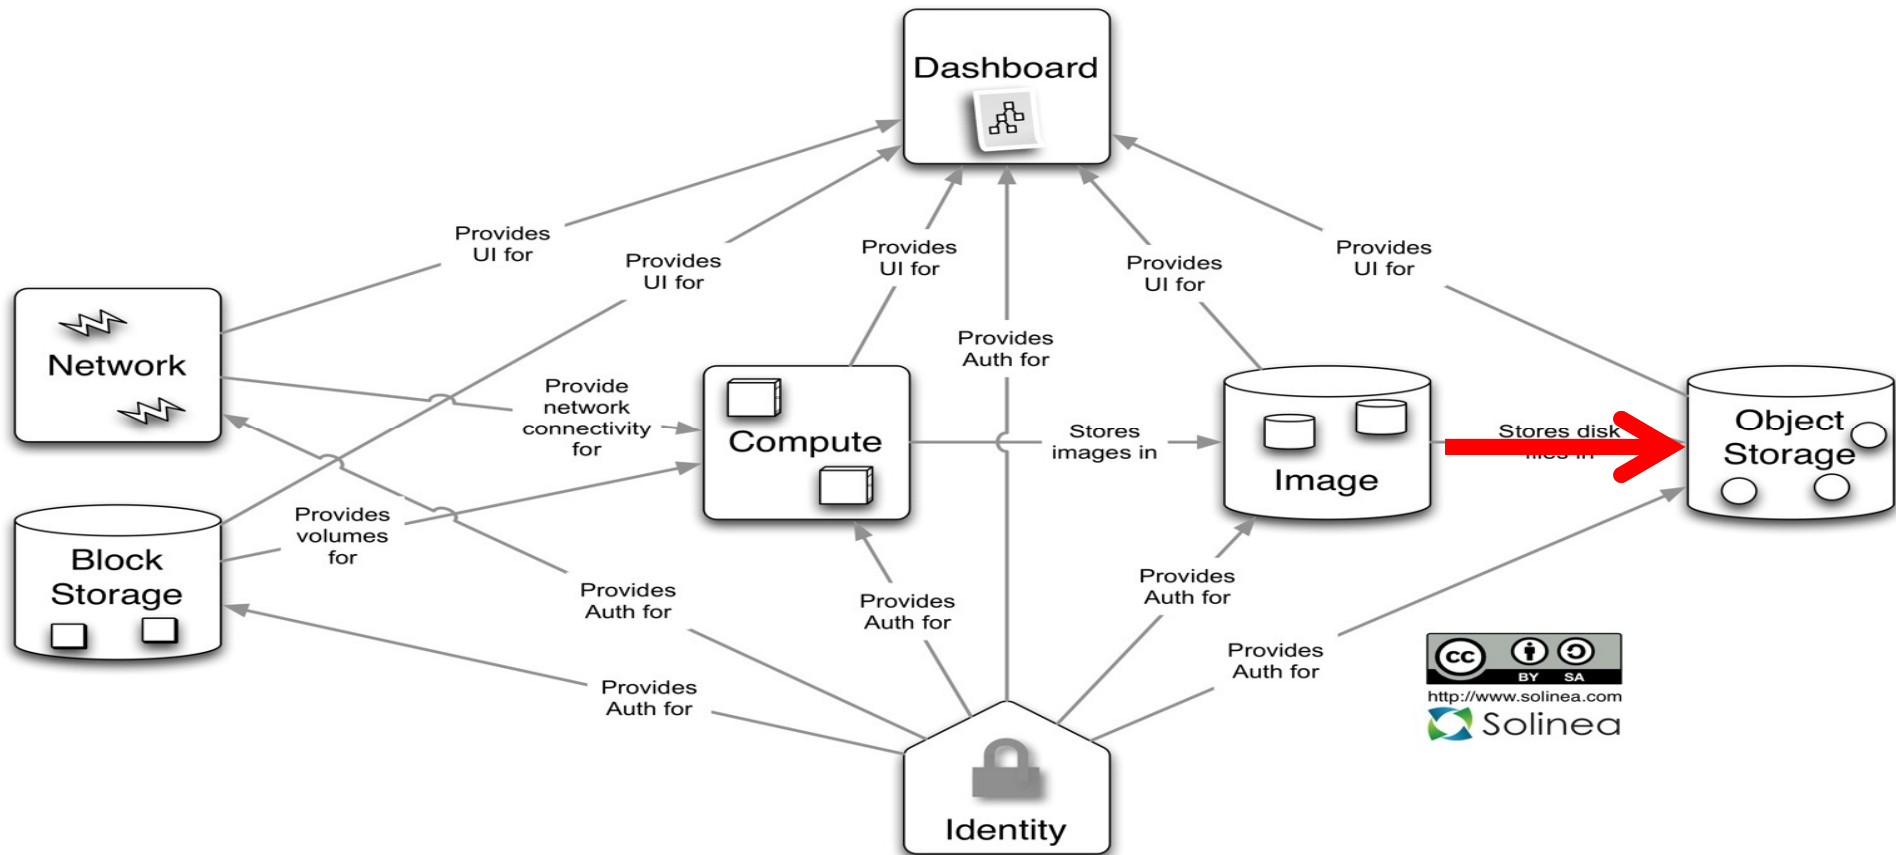

## 2. Start a new compute server

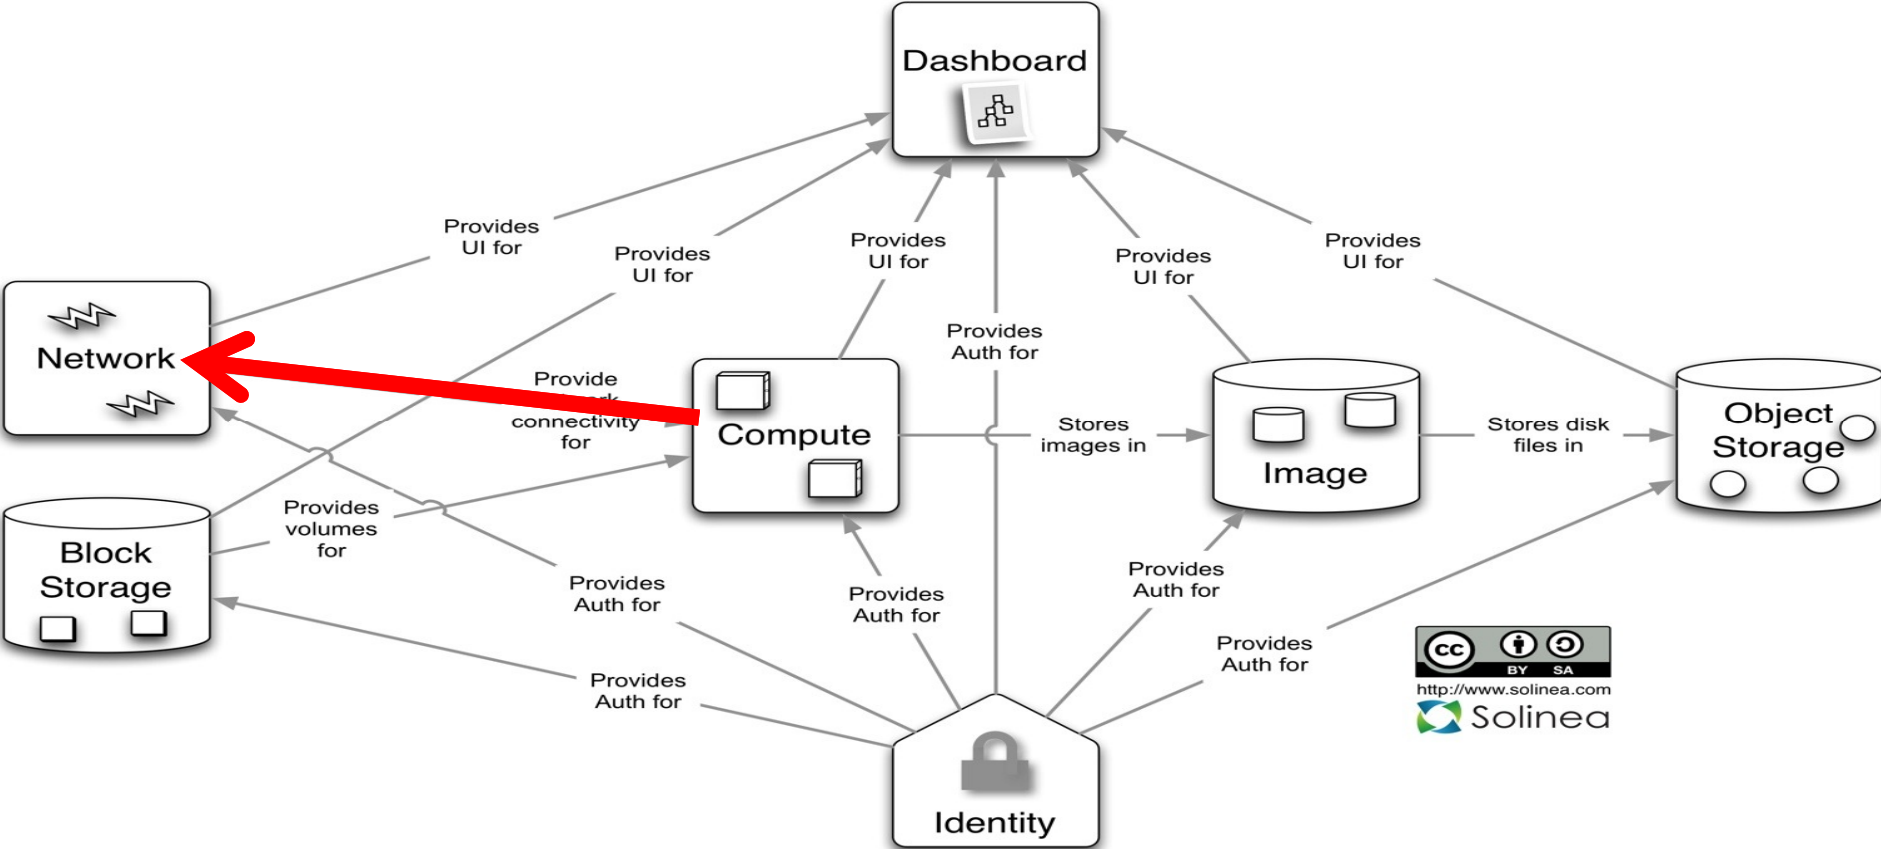

### 3. Download the ubuntu12.04 image

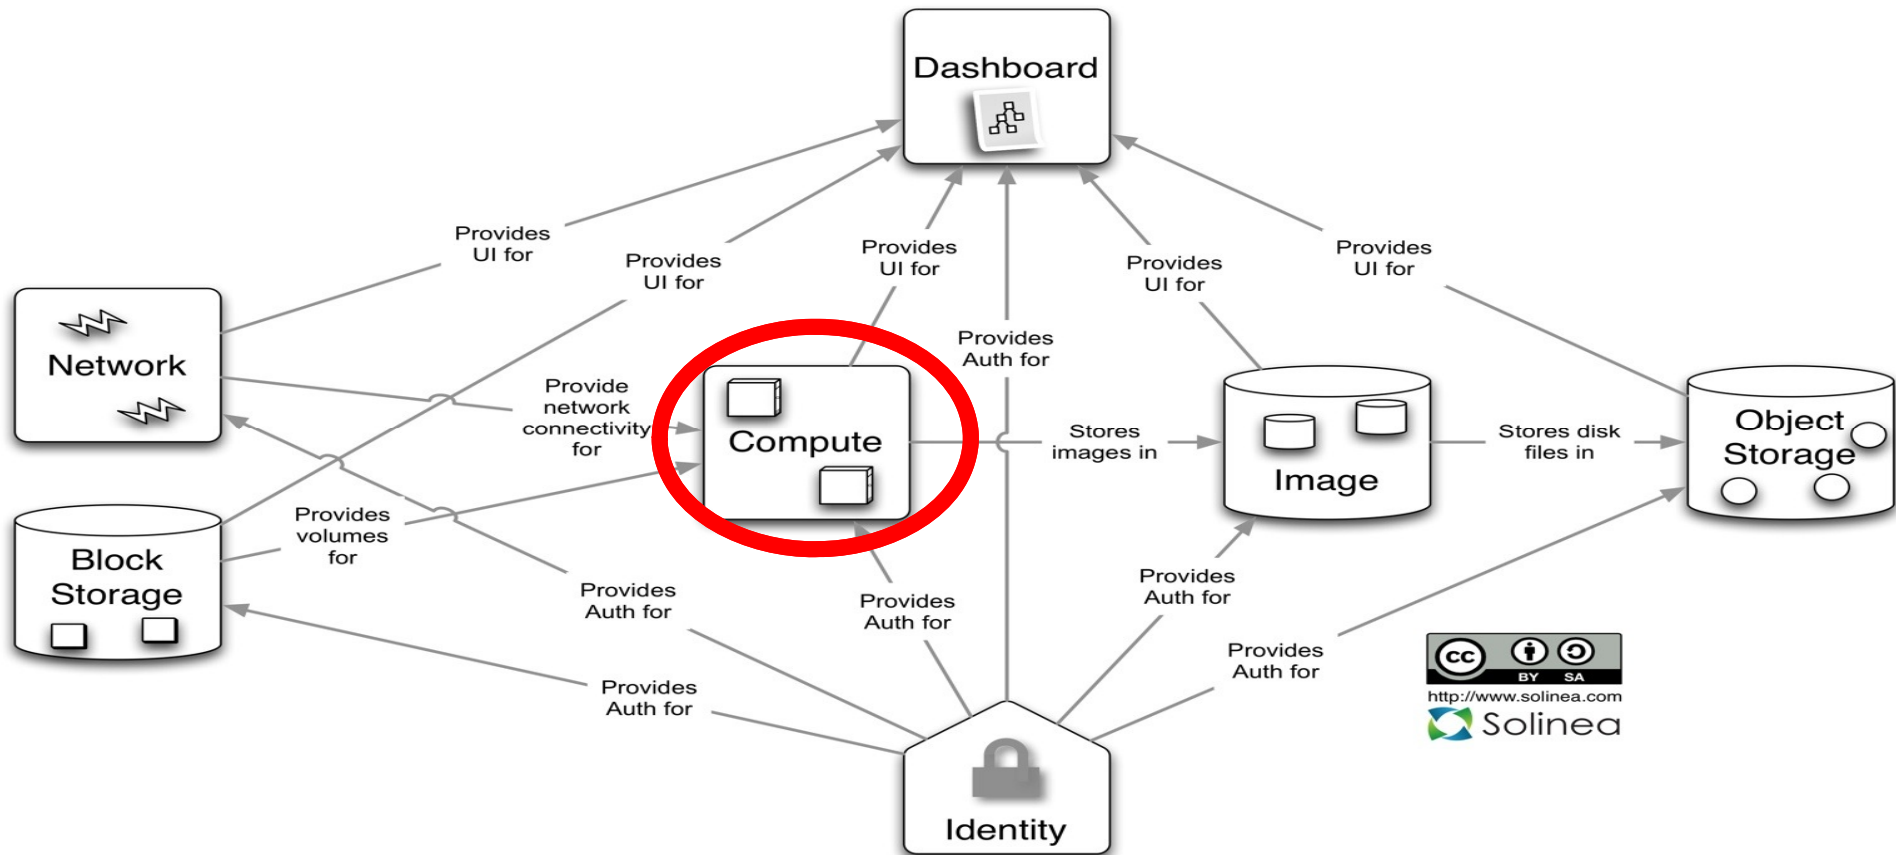

## 4. Retrieve the image from the object store

# 5. Determine how to connect the VM to 'mynet'

## 6. Start the virtual machine

Alice sees that her server is now running and connects to it via ssh.

# Alice's OpenStack Picture

Compute	Web servers
Networking	Load balancers, private network to database
Block Storage	Code and configuration
Object Storage	Application assets, user uploaded files
Database	State storage

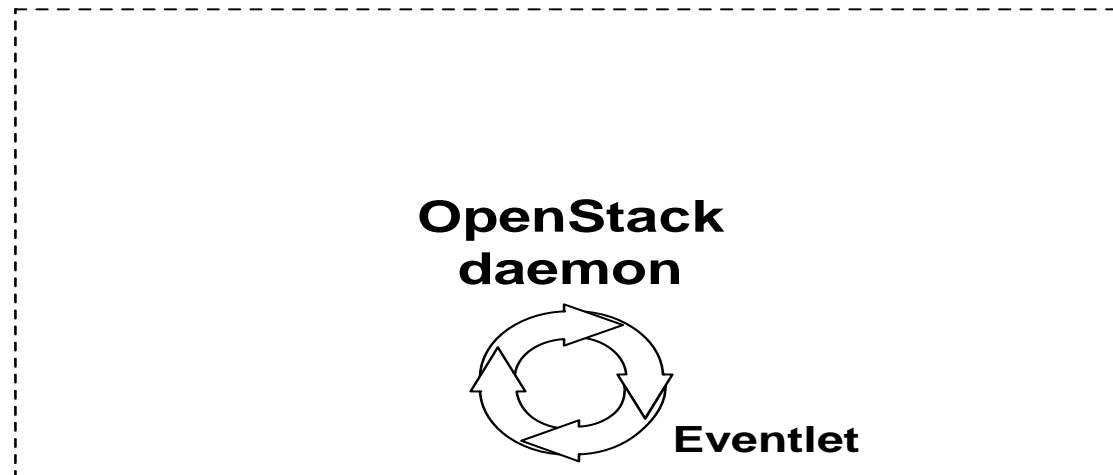

... but how does that work?

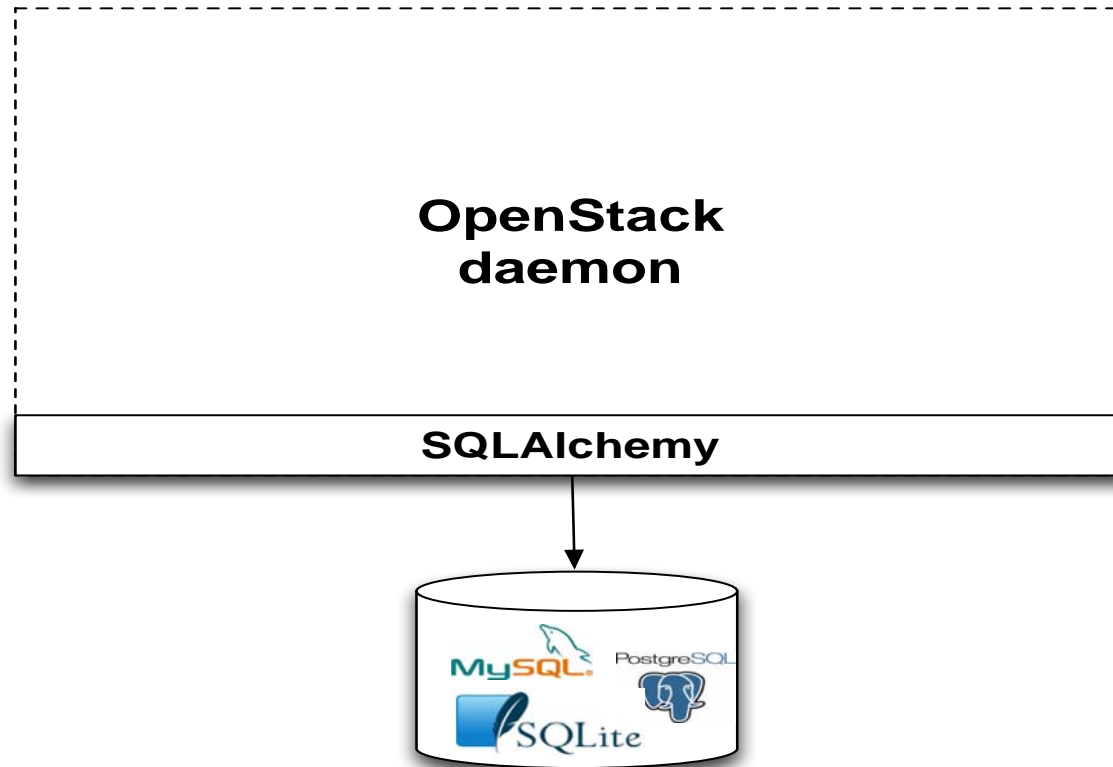

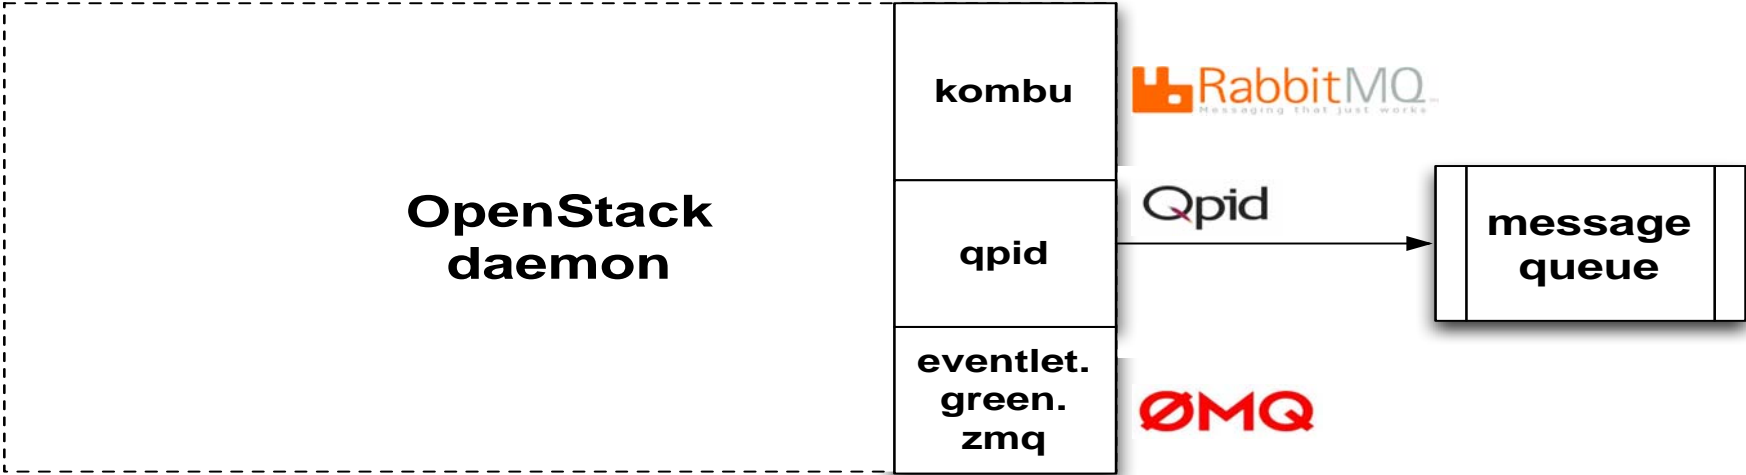

Daemons use non-blocking I/O with *eventlet* to handle multiple requests

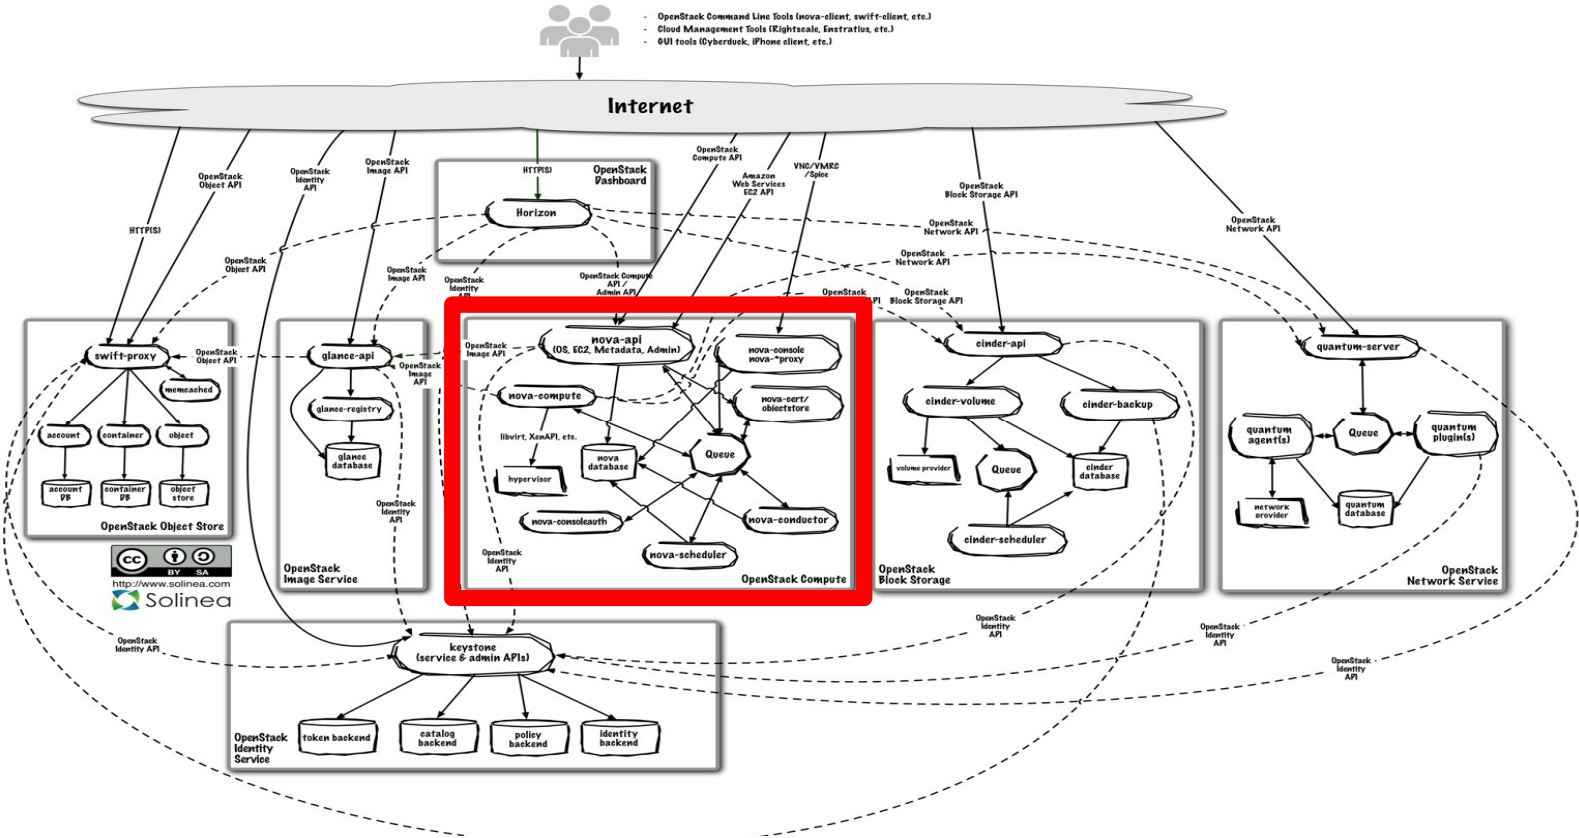

# Daemons maintain persistent state using an SQL database via SQLAlchemy

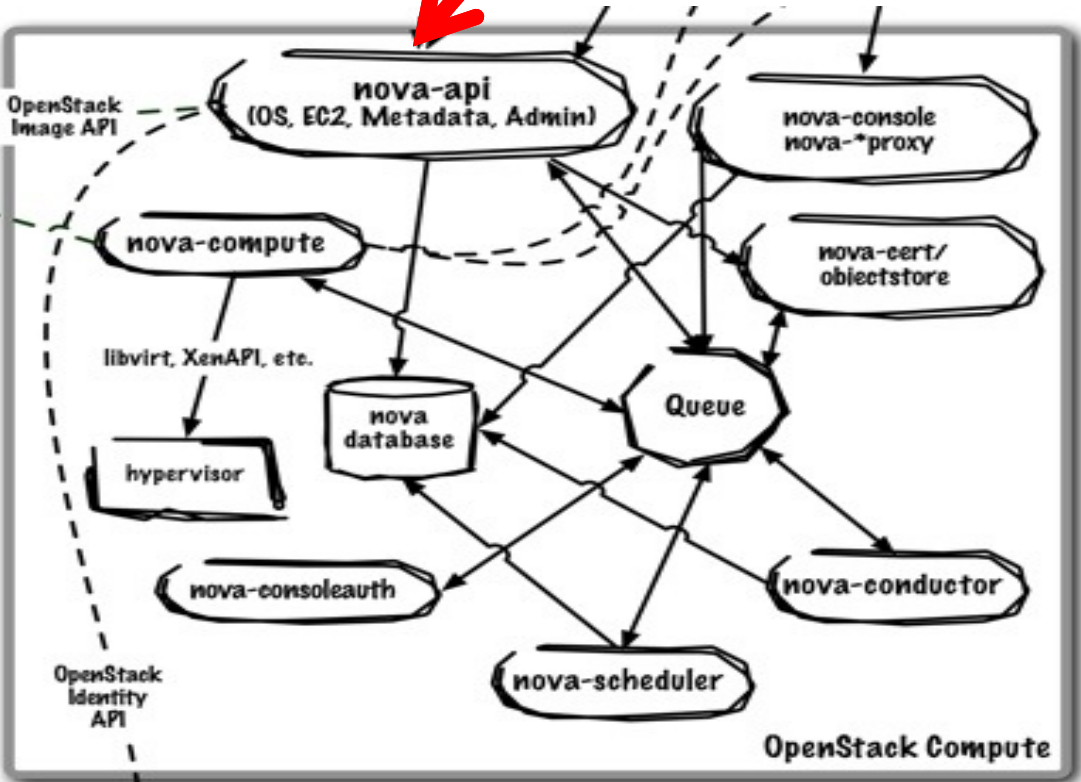

# Daemons communicate using remote procedure call over message queue

# Let's go back to the earlier example

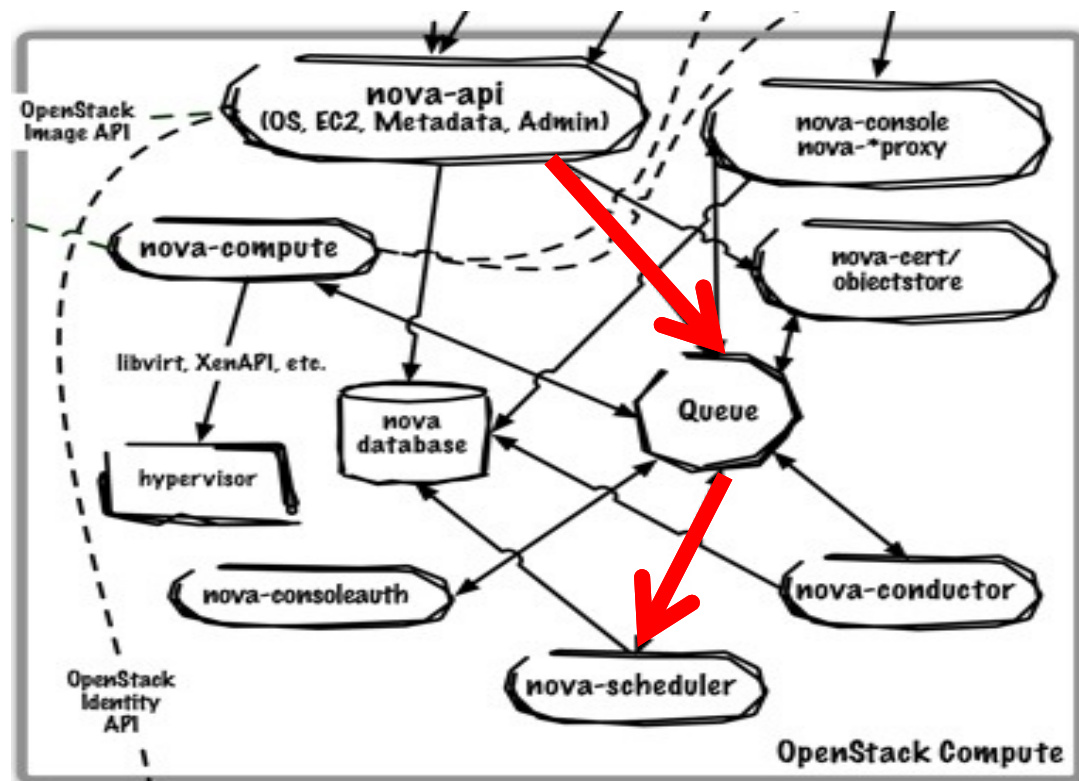

“Start a new compute server” request comes in to the *nova-api* daemon

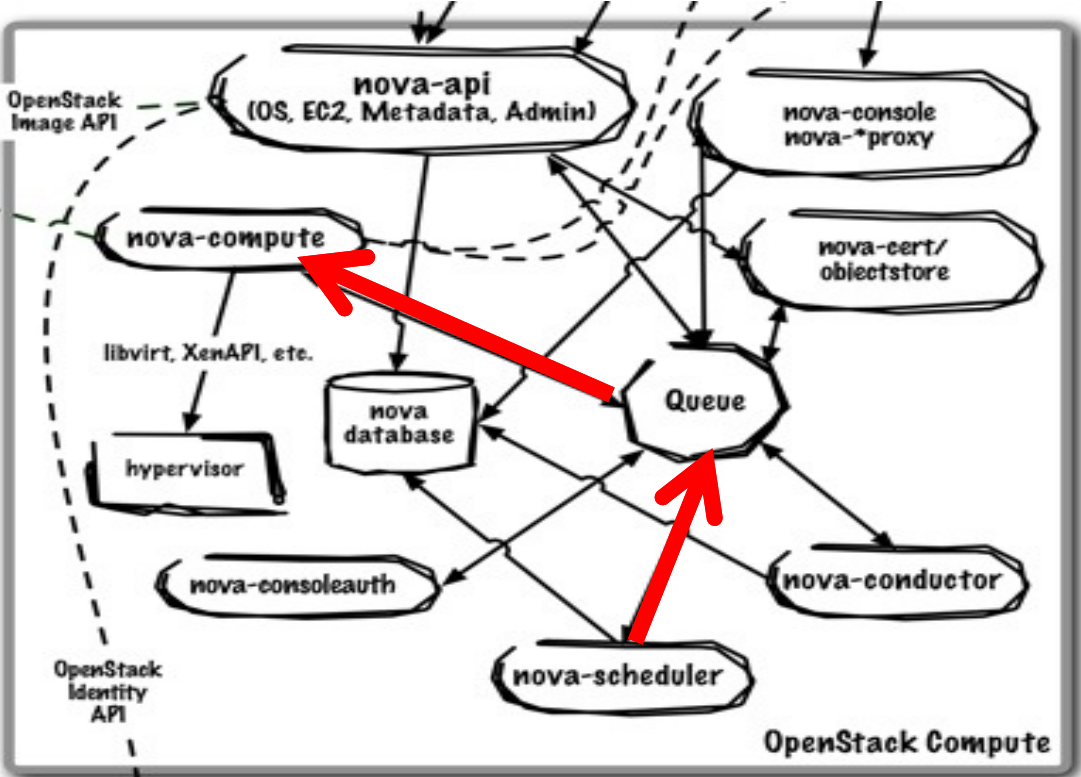

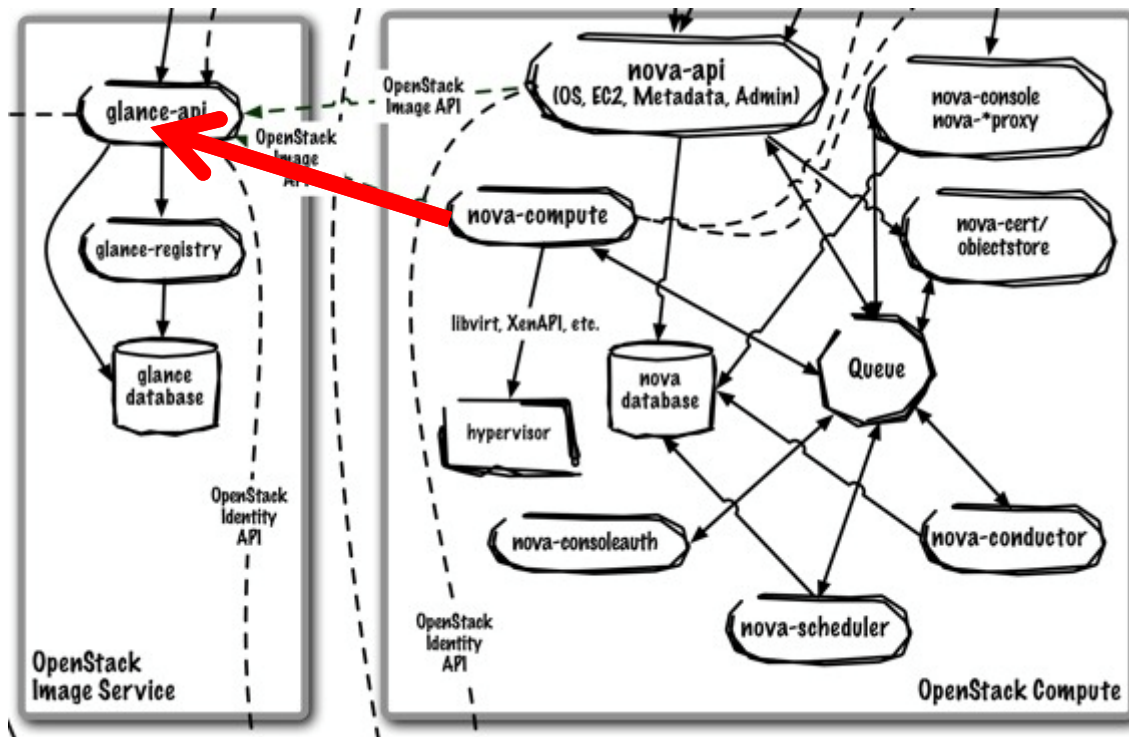

Ask *nova-scheduler* to find a compute node that can fulfill the request

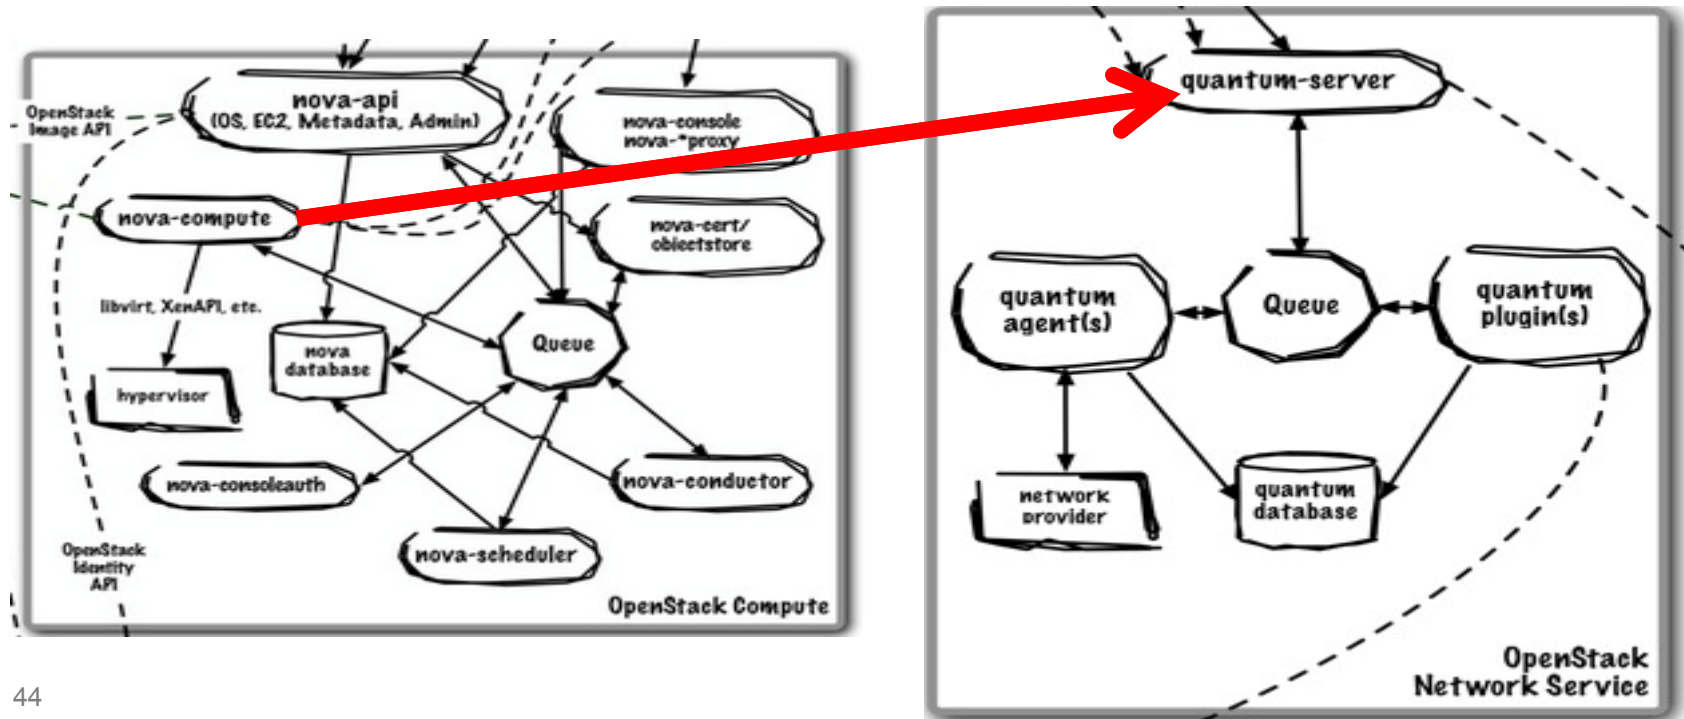

Dispatch the request to *nova-compute* on a node that has enough resources

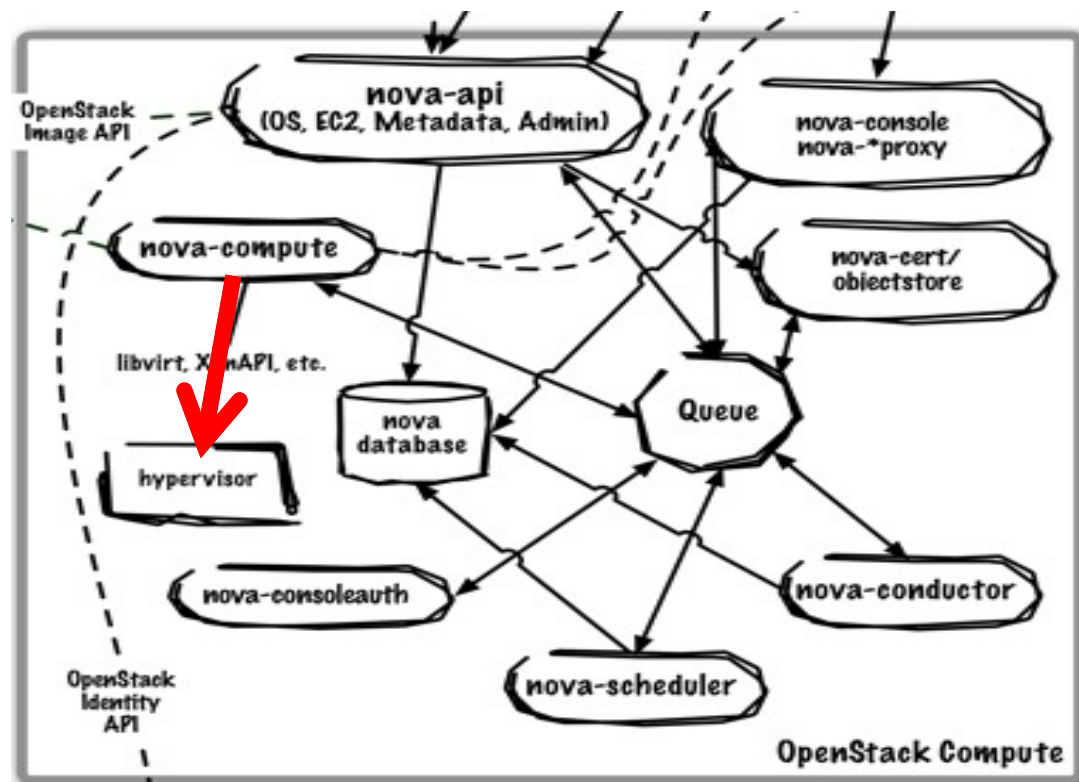

# Download the image from the Image service

## Get network connection info from Networking service

Ask the hypervisor to start the virtual machine

So, what is OpenStack?

# OpenStack Mission

To produce the

**ubiquitous open source cloud computing platform**

that will meet the needs of public and private clouds regardless of size, by being simple to implement and massively scalable.

# The OpenStack Foundation

**Protecting, Empowering, and Promoting** OpenStack software and the community around it, including users, developers and the entire ecosystem.

- Over 14,400 Individual Members, up from 5,600 at launch
- The leading Global IT companies as Gold & Platinum Members
- Board of Directors that sets strategic direction
- Project Technical Leads and a Technical Committee that are elected from among the contributors
- User Committee to ensure your voice is heard

## Interacting with the Community

- All development is open
  - Etherpad → Blueprint → Coded → Reviewed → Released
- Collaboratively design features
- Competitors working together
- Every line of code reviewed by at least two people
- An extensive continuous integration and testing infrastructure

Documentation, Translation, Infrastructure is all Collaborative

You are welcome to join!

## Customisation

- OpenStack doesn't quite do what you need?
  - Add it, but contribute back if possible
- Many things are pluggable
  - Eg Object Storage Middleware Pipeline
  - Eg Compute Scheduler
  - Eg Dashboard
- Get a DevStack running and play!

## Interacting with the Community

- Ask OpenStack! (<http://ask.openstack.org/>)
- <https://wiki.openstack.org/wiki/MailingLists>
- <https://wiki.openstack.org/IRC>
- Your local user group
- The comments section on that almost-related blog
- The OpenStack User Survey

// DEVELOPERS // USERS // OPS

ATLANTA, USA

## May 12-16 – Atlanta, USA

Design Sessions: not a classic track with speakers and presentations - generally an open brainstorming discussion on a given feature

Conference Sessions: Keynotes, Case Studies, Ecosystem, Operations, Strategy, Workshops

Thank you for  
supporting OpenStack
