

# OpenStack Operation Under a Multi-tenant and Multi-customer Public Cloud Environment

2016年7月7日  
NTT Communications 堀田孝司

Transform your business, transcend expectations with our technologically advanced solutions.

# Outline

1. Introduction
2. Requirements for Our Service
3. Challenges
4. Solutions
5. Conclusion

# Introduction

- Headquarters in Tokyo, Japan
- NTT Communications is one of the leading cloud providers in Japan
- One of the biggest datacenter operators in the world
- Services
  - Datacenter (140+ countries/regions)
  - VPN (196 countries/regions)
  - Global Tier1 Internet Backbone (Top 3 worldwide)
  - Worldwide Marine Cable (Top 10 worldwide)
  - IaaS/PaaS services worldwide , etc.

# In what service do we use OpenStack?

- NTT Communications Enterprise Cloud
  - IaaS/PaaS/Managed Cloud

# NTT Communications' Enterprise Cloud in the Global Market

■ Available in 14 different regions (+1 planned)

■ Global Affiliates

- NTT America
- NTT Europe
- NTT Singapore
- NTT Com Asia
- NTT Com ICT, etc.

■ Multiple support teams

■ Multiple languages

# Why use OpenStack?

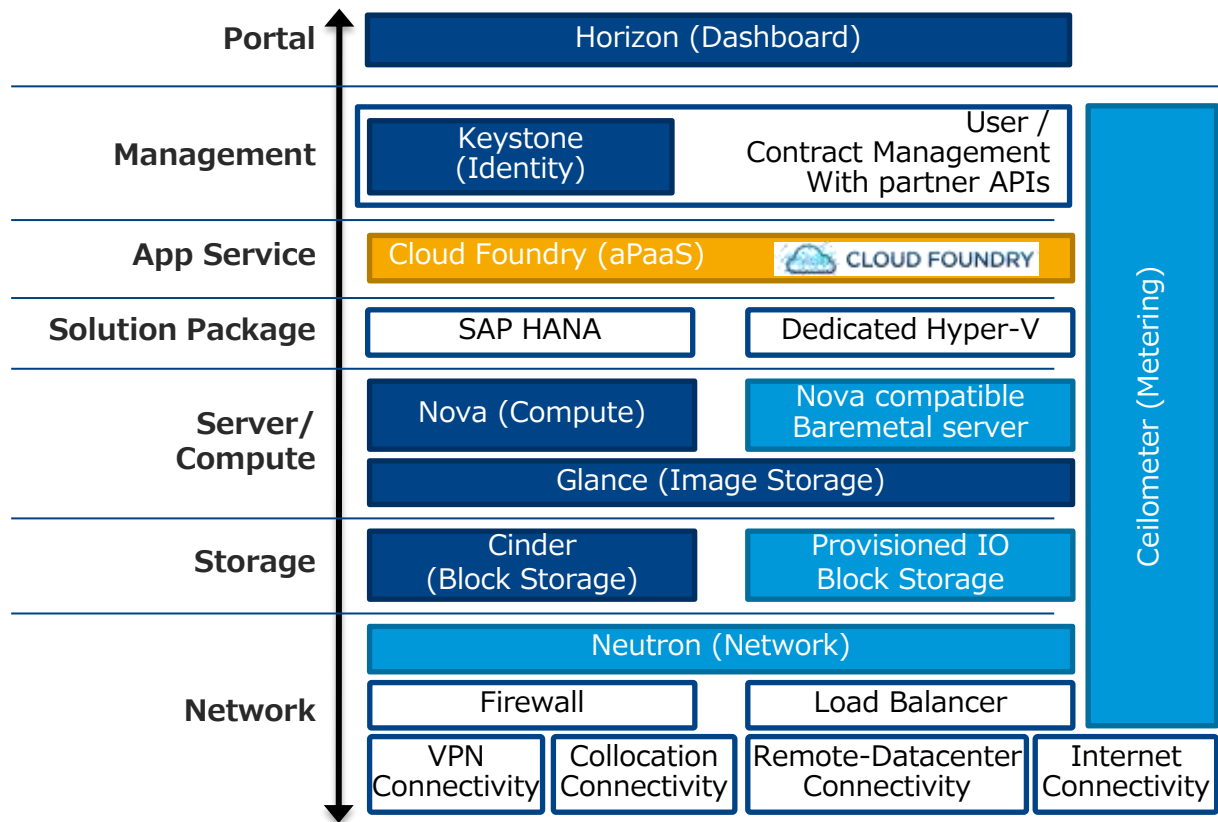

- NTT Communications Enterprise Cloud utilizes OpenStack because
  - Open-source
  - Expanding and active developer community
  
- Version used: JUNO

JUNO  
THE TENTH OPENSTACK RELEASE

<http://www.openstack.org/software/juno>

# OpenStack Components / Others in Enterprise Cloud

- : OpenStack Component
- : Original Component with Compatible/Partially compatible API
- : Original Component
- : Other OSS

- Main target users: Enterprise users
- There are gaps between the OpenStack community version and what the user wants as an IaaS
  - High Availability (HA) function for Virtual Machines
  - Multi-customer / Multi-tenant Environment

# Requirements for Our Service

# Requirements for Our Service

1. To support both traditional IT and cloud-native IT
2. Multi-customer/multi-tenant environment

- 1. To support both traditional IT and cloud-native IT**
2. Multi-customer/multi-tenant environment

# Requirement: To support both traditional IT and cloud-native IT

## Pet Model

- Unique and given names
- Cared for
- Nursed back to health when sick

vs

## Cattle Model

CC-BY-SA3.0 By Daniel Schwen  
<http://creativecommons.org/licenses/by-sa/3.0/>

- Identical to one another / cannot tell apart
- Easily replaced

# Requirement: To support both traditional IT and cloud-native IT

## Pet Model

- Traditional IT
- Currently legacy apps cannot yet be easily replaced
- Case: If one VM goes down it will impact the end-user greatly

## Cattle Model

- Cloud-native IT
- Designed apps for cloud architecture
- Case: If one VM goes down it would not be noticeable to the end-user
- This is the direction for the future

# To support pet model: Virtual Machine High Availability

- What is VM-HA
  - Virtual machines on the cloud automatically restart in case of any failure
- Why VM-HA is required in Enterprise Public Cloud
  - From user perspective
    - ✓ Minimize impact to traditional IT
  - From Public IaaS provider perspective
    - ✓ Keep public IaaS working even if incidents/outage occurs

# Challenge: How to implement VM-HA

- OpenStack Community version doesn't have VM-HA function
- Implement VM-HA to Nova doesn't match the design concept of Nova/OpenStack
  - Application should be change to cloud native architecture
- If we implement VM-HA to Nova...
  - Maintenance/operational cost increase, so it could create a big obstacle for OpenStack version upgrade

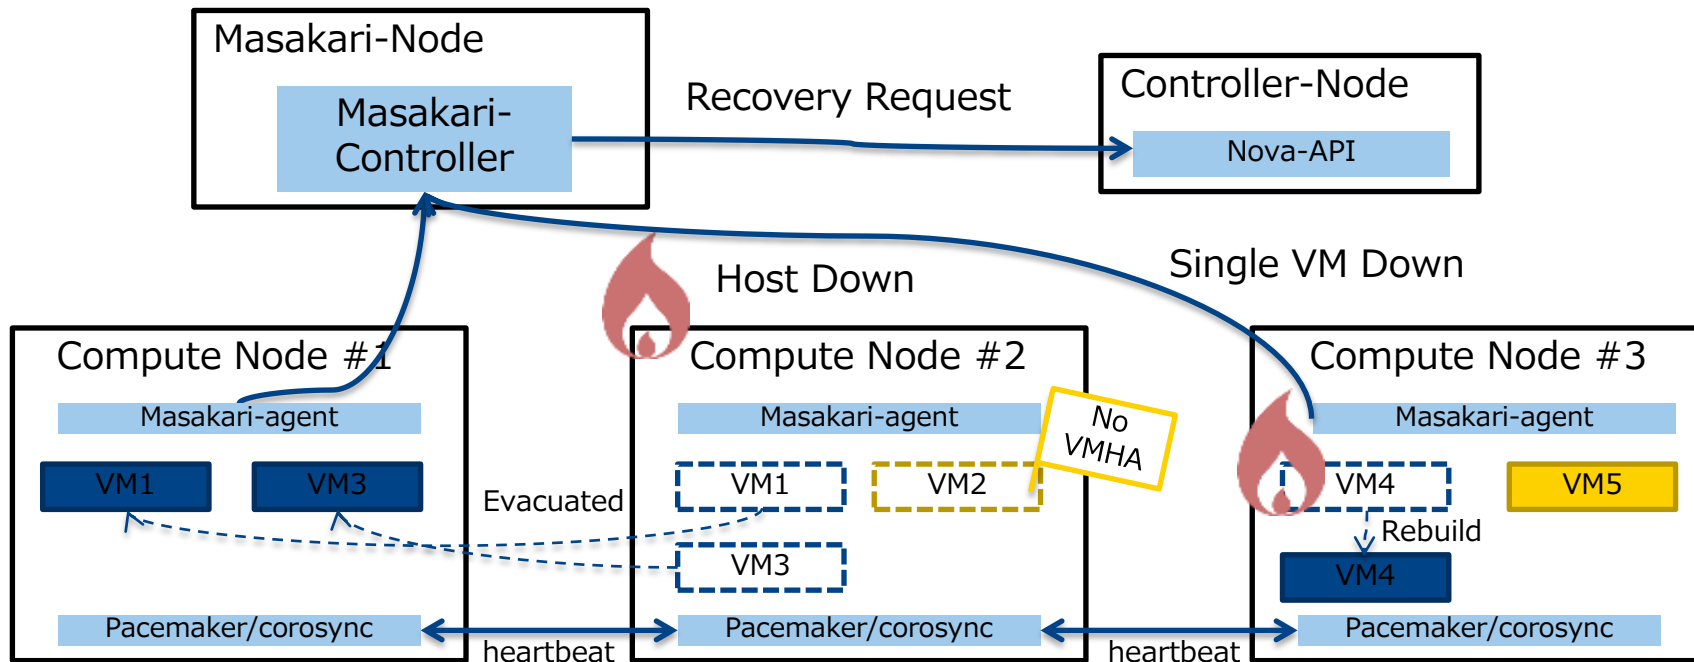

# Solution: Masakari, VM-HA in OpenStack

- To realize VM-HA in OpenStack: Masakari
  - Masakari is open source : (<https://github.com/ntt-sic/masakari>)
  - Extra component / deploy it outside of OpenStack
  - Not need to modify OpenStack's source code
- From service requirement for Pets Model
  - Rescue VM down (VM single down/Host Down)
  - VM recovery within 5mins
  - Work Automatically
- From service requirements for Cattle Model
  - Customer can choose not to use VMHA function provided by Masakari

# Solution: Masakari Architecture

- Masakari can rescue a VM affected by the Host Down and Single VM Down incident
  - Masakari(Controller/Agent) • Pacemaker/Corosync

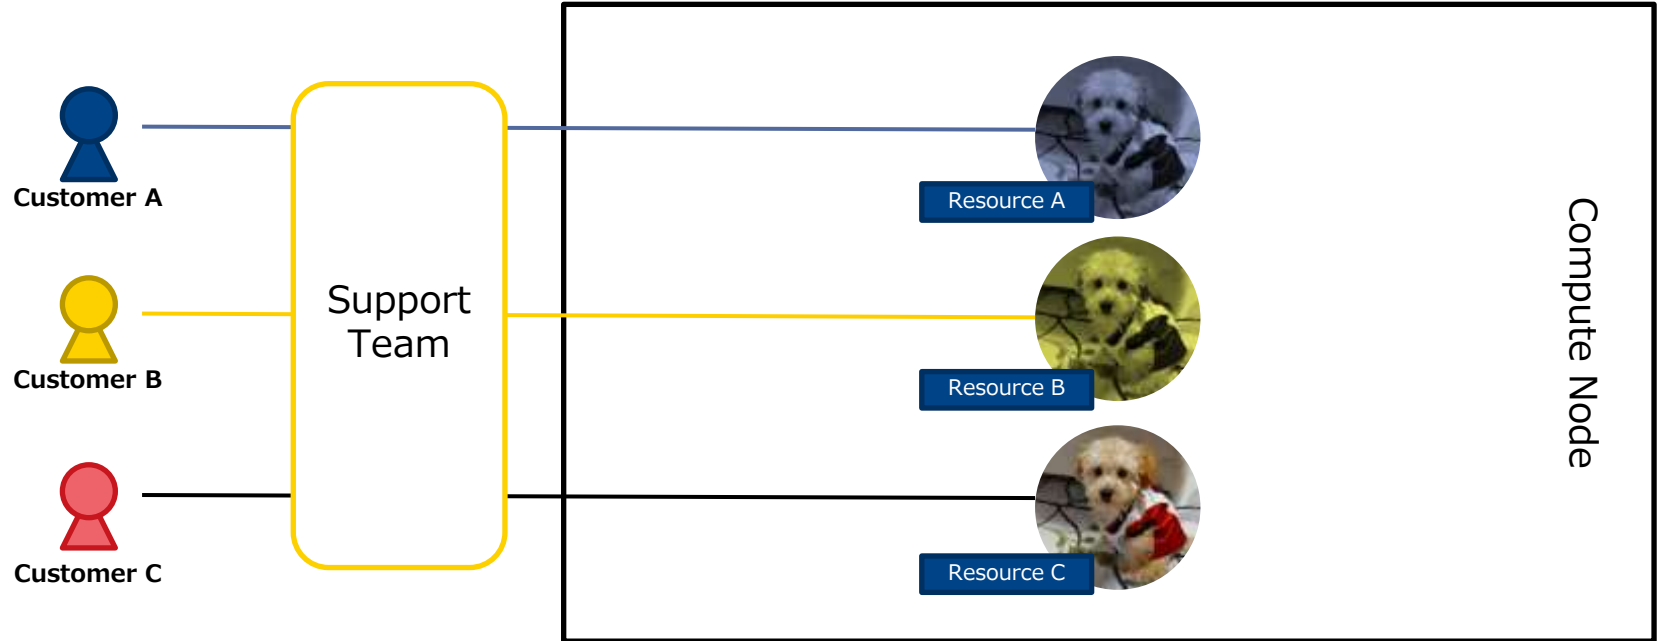

- 1. To support both traditional IT and cloud-native IT**
2. Multi-customer/multi-tenant environment

1. To support both traditional IT and cloud-native IT
- 2. Multi-customer/multi-tenant environment**

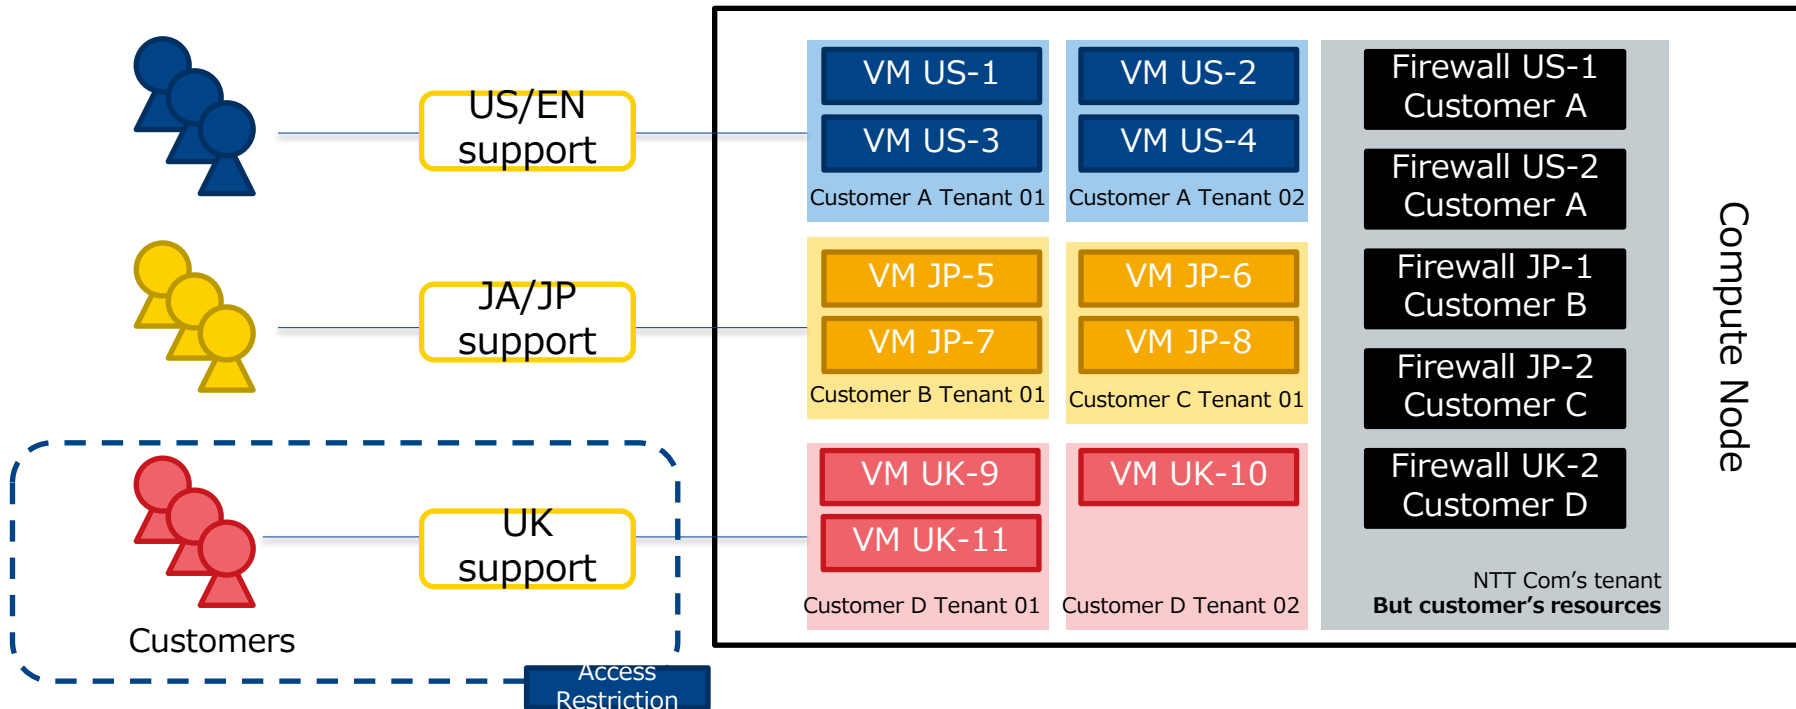

# Requirement: Multi-Customer / Multi-Tenant Environment

- In the PET model, when an incident occurs we need to track a lot of information in order to notify the customer

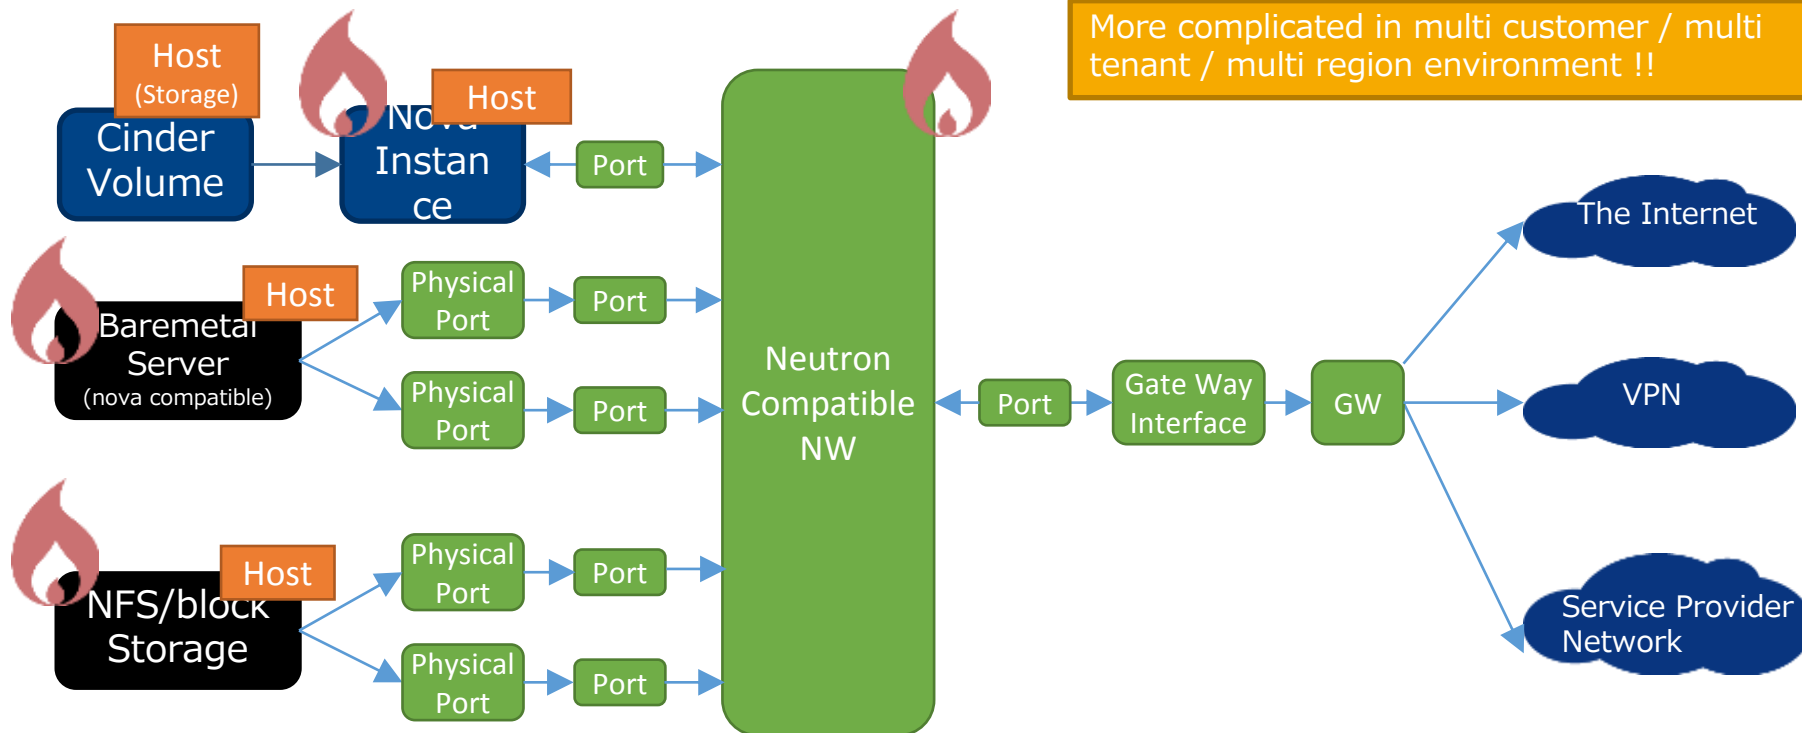

# Requirement: Multi-Customer / Multi-Tenant Environment

- Difficult to track in actual environment

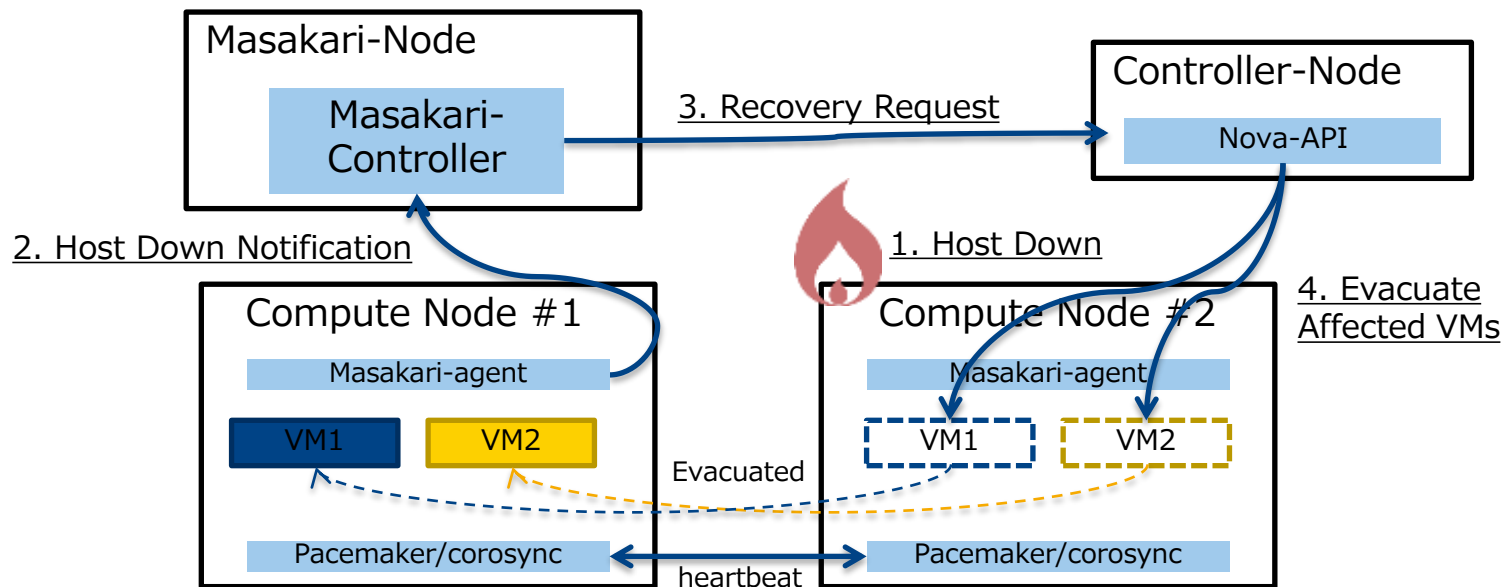

# Challenge (1): a lot of Logical/Physical Resources related

- One incident could affect multiple resources

# Challenge (2): VM-HA itself cause missing the VM location

- Sometimes evacuation takes time
- Missing VM location
  - Hard to know which resources has been affected
- Some failures may happen for evacuation itself

## Challenge (3): DB Search / Log Tracking

- Searching DB and tracking the relationship of resources is possible BUT:
  - Needs to search across the multiple service DB
  - DB search takes time
- The Masakari log just indicates the log of trigger for VM-HA
- The OpenStack DB shows only the current values and cannot display historical values or statuses

# Solution: Operation Portal for Support / Operation Engineers

1. Resource state/location history collection for multiple services
2. Incident Ticket Association with resources information

The portal for:

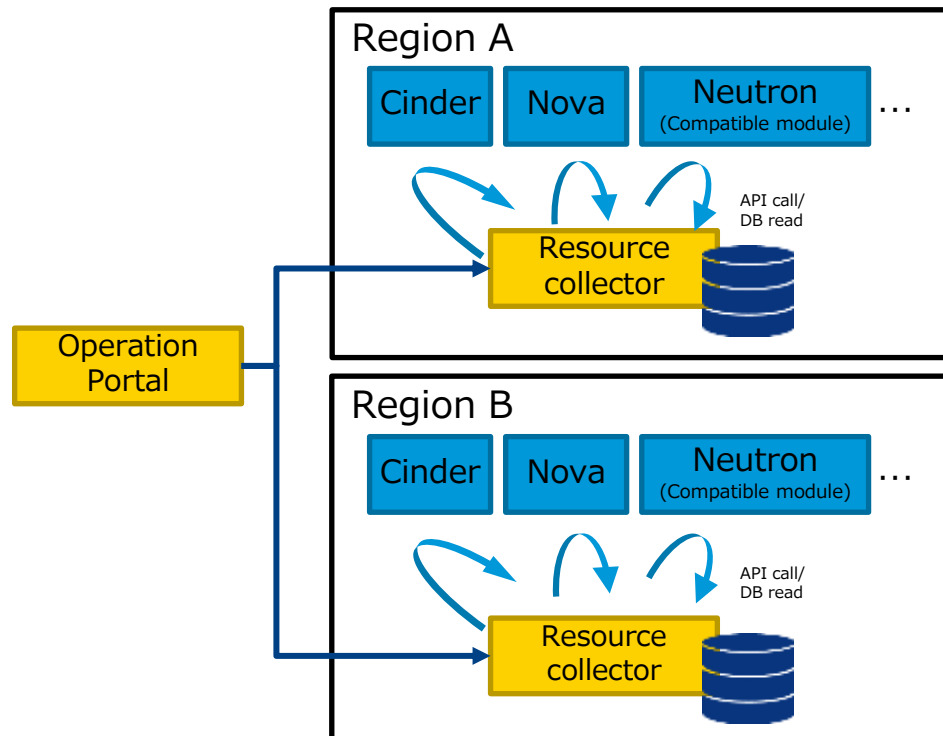

- Check incident ticket
- Check resource relationship mapping
- Check Virtual Resources Location History

# Solution (1): Resource state/location history collection

- Collect all historical resource records from OpenStack services
  - Show that resources information for Operators

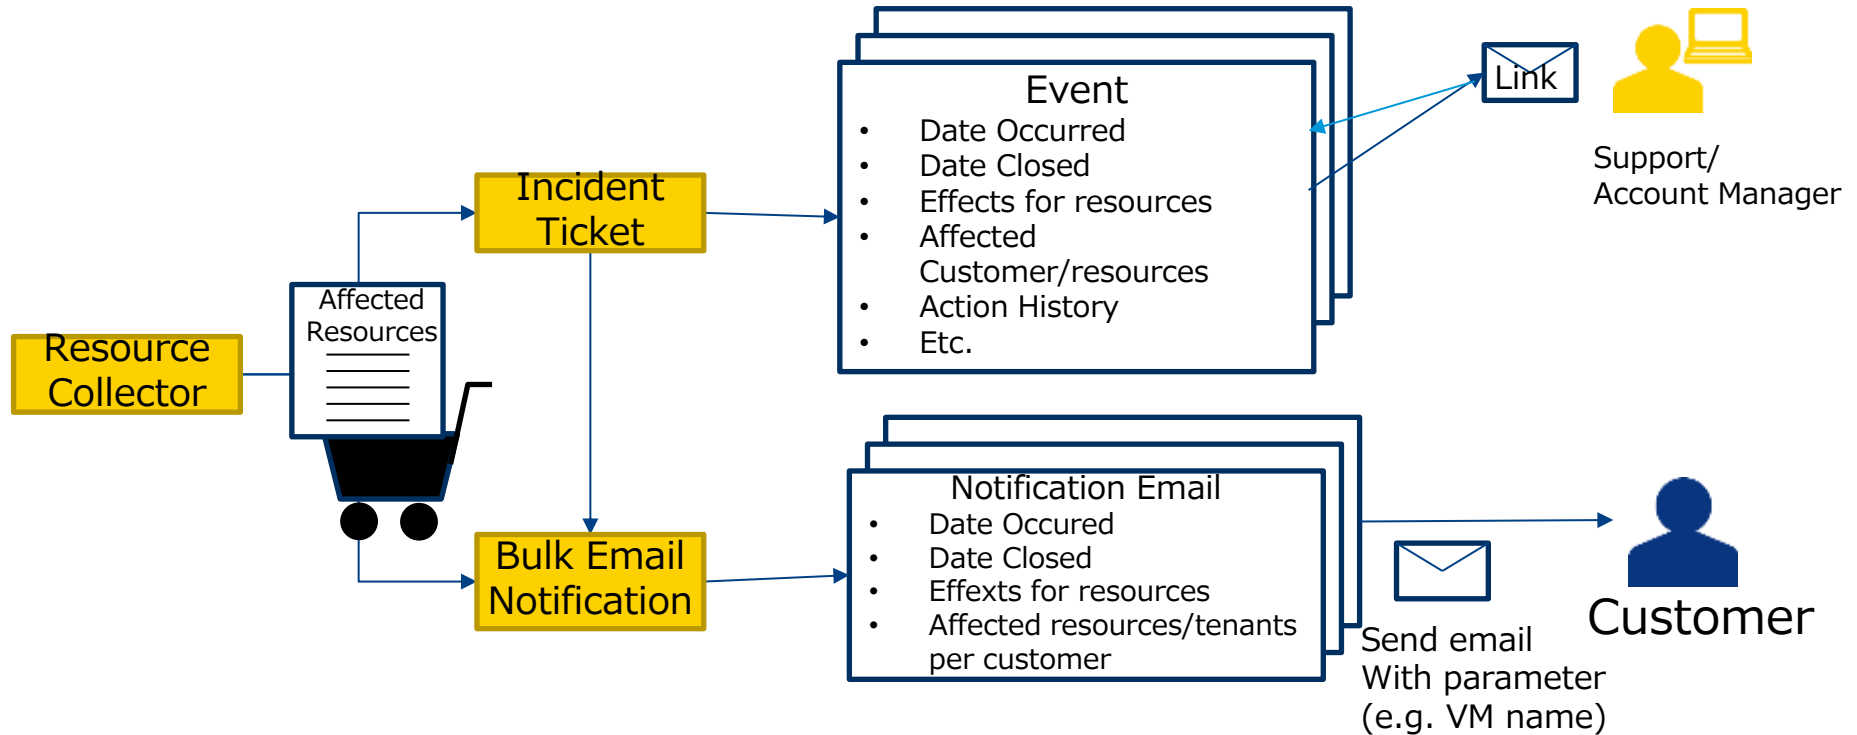

## ■ Collected Resources

- Nova (from DB)
  - ✓ instances.\*
  - ✓ Instance\_metadata
  - ✓ aggregate\_metadata
  - ✓ aggregate\_hosts
- Cinder (from DB)
  - ✓ Volumes.\*
- Neutron (from Admin API)
  - ✓ Subnet
  - ✓ Port
  - ✓ IP
  - ✓ etc...

# Solution (2): Incident Ticket Association with resources

- All the information is associated with tickets

# Actual Use Cases and Demo

# VM failover scenario with operation portal

- The host down issue scenario
  1. alert from the monitoring team
  2. operator check which hypervisor gets down and check which VMs are affected
    - Basically VMs are restarted automatically by VM-HA Masakari
  3. send the incident notification
  4. send the recovery notification

# Send Notification

- Use notification template with parameters

Thank you for using NTT Communications Enterprise Cloud 2.0 service.  
We would like to inform the recovery of following incident.

## Tenant

ID: `$tenant.tenantId`

Name: `$tenant.tenantName`

## Affected Your Resources

`#if ($vms)`

[Virtual Server]

`$vms`

`#end`

`#if ($fwfs)`

[Firewall]

`$fwfs`

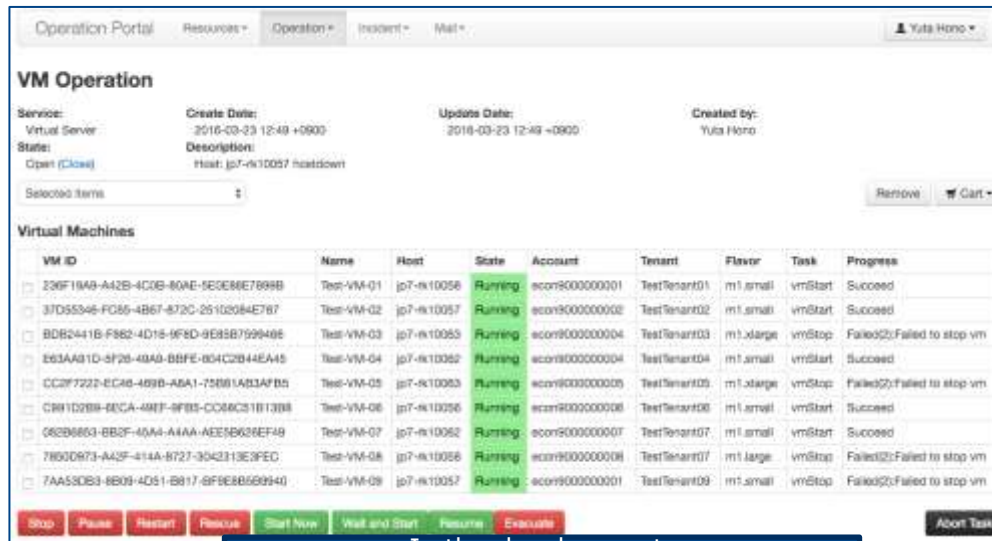

`#end`

Velocity Template style  
statement

# Future Enhancement

- Operation Automation / Hand-over to lower Tier Engineer
- Automate incident ticket creation/notification for customer with pre-defined pattern for known-pattern incidents
- Will provide this functionality for our partners also

The screenshot shows a web interface for VM operations. At the top, there are tabs for 'Operation Portal', 'Resources', 'Operation', 'Incident', and 'Mail'. The 'Operation' tab is active. Below the tabs, there's a header 'VM Operation' and a summary section with fields for 'Service', 'Virtual Server', 'State', 'Create Date', 'Update Date', and 'Created By'. The 'State' is 'Open (Click)'. Below this is a 'Selected Items' dropdown and 'Refresh' and 'Cart' buttons. The main section is titled 'Virtual Machines' and contains a table with columns: VM ID, Name, Host, State, Account, Tenant, Flavor, Task, and Progress. The table lists 9 VMs with various states like 'Running' and 'Failed'. At the bottom, there are buttons for 'Stop', 'Pause', 'Restart', 'Rescue', 'Start Now', 'Wait and Start', 'Resume', 'Execute', and 'Abort Task'.

VM ID	Name	Host	State	Account	Tenant	Flavor	Task	Progress
236F1848-A42B-4C0B-80AE-9E5E8E7899B	Test-VM-01	ip7-nk10056	Running	econ9000000001	TestTenant01	m1.small	vmStart	Succeed

In the development:  
multiple resources operation from GUI

- Introduced our use case of OpenStack operation under a multi-tenant and multi-customer public cloud environment
  - Achieved quick notification to each customer and recovery VMs affected by incidents with resource history collection / VM-HA Masakari
- Contribution to the OpenStack community
  - NTTCom would keep contributing to the OpenStack community with knowledge from public IaaS operation experiences
    - ✓ Feedback / sending patches to community
    - ✓ Knowledge sharing with the community in the summit
